1 Introduction

1.1 Scope

This document describes the Pre-Analysis (PA) component of the AMD Advanced Media Framework (AMF). Full documentation on AMF can be found at <https://gpuopen.com/gaming-product/advanced-media-framework/>.

1.2 Overview

The AMF PA component accepts raw input images in NV12 format. It calculates a metric for content activity of different blocks across every image, as well as video property flags such as scene change and static scene flags. In the current release, spatial complexity is used as a measure of activity inside each block.

These results can be leveraged during an encode session targeting improved perceptual quality of the encoder's reconstructed video signal, or it can be used to report information back to any other application for leverage in a way the SDK user may see fit. The AMF PA component does not alter the input images in any way; pixels within images will be inspected but no pixel value will be changed.

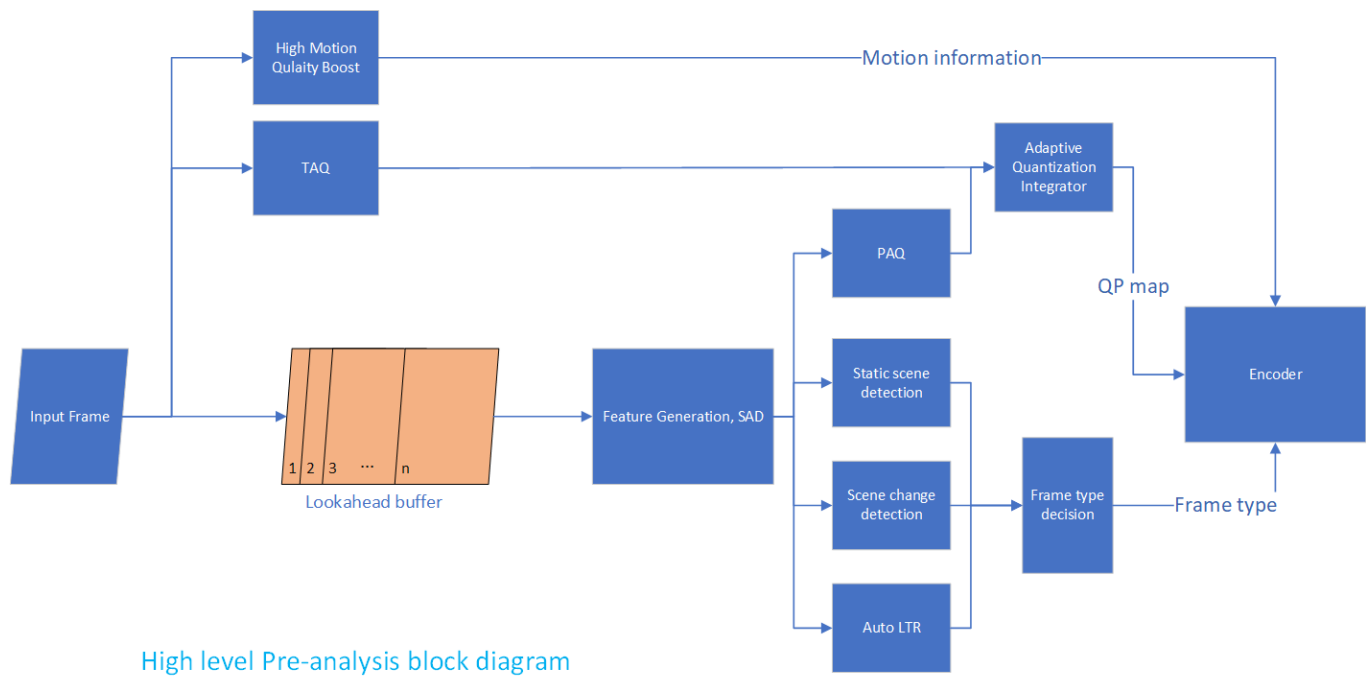

Figure 1 high level PA block diagram

The AMF PA component aims at being codec-agnostic. Content adaptive encoding using PA may also help to expand the HW encoder's capabilities. The analysis results will be used by AMD HW encoder(s) to potentially improve the overall encoding quality. Perceptual quality improvement impacts the distribution of bits among different video units, and hence it may sometimes lead to drops in quality when measured in objective metrics such as PSNR.

The AMF PA component can be used in one of two modes: encoder mode or standalone mode. In the encoder mode, the AMF PA component is instantiated as part of the AMF HW encoder pipeline. It analyzes the encoder input data before encoding. In the standalone mode, the AMF PA component is instantiated as a separate AMF component. It takes in raw video images and outputs a set of video statistics, which can be passed to third party encoder(s) or any other application(s).

1.3 Supported Hardware

The AMF PA feature is supported by Radeon RX 5000 Series or newer GPUs as well as Ryzen 2000 U/H series or newer APUs.

1.4 Disclaimer

The current AMF PA component is in its beta release. Existing features may get optimized over time, and new features may also be added in future releases.

2 AMF PA - Encoder Mode

The AMF PA component is instantiated within the AMF Encoder component as part of the encoder's pipeline. The encoder's input is first pre-analyzed by PA. During encoding, when either `AMF_PA_PAQ_MODE` or `AMF_PA_TAQ_MODE` is enabled, adaptive quantization is applied based on the results generated by PA. The encoder also makes various encoding decisions based on PA results. For example, depending on whether the PA scene change detection flag is triggered or not, the encoder may force an intra encoded frame and apply a new frame QP at the new scene. The encoder may also insert a skip frame based on whether the PA static scene detection flag is triggered or not.

`AMF_PA_PAQ_MODE` and `AMF_PA_TAQ_MODE` cannot work with VBAQ (`AMF_VIDEO_ENCODER_ENABLE_VBAQ`) features. When `AMF_PA_PAQ_MODE` or `AMF_PA_TAQ_MODE` is enabled, VBAQ settings are ignored.

`AMF_PA_HIGH_MOTION_QUALITY_BOOST_MODE` and `AMF_PA_TAQ_MODE` both requires multiple frames lookahead. These two features take effect only when `AMF_PA_LOOKAHEAD_BUFFER_DEPTH` is set to 11,21 or 41.

2.1 Input / Output Format

The input / output is handled by the AMF Encoder component. No special setting is needed for AMF PA.

2.2 Properties

Table 1 shows the available parameters in AMF PA encoder mode. The list underneath provides the detailed description of these parameters.

Name (prefix "AMF_PA_-")	Type
ENGINE_TYPE	AMF_MEMORY_TYPE
ACTIVITY_TYPE	AMF_PA_ACTIVITY_TYPE_ENUM
SCENE_CHANGE_DETECTION_ENABLE	bool
SCENE_CHANGE_DETECTION_SENSITIVITY	AMF_PA_SCENE_CHANGE_DETECTION_SENSITIVITY_ENUM
STATIC_SCENE_DETECTION_ENABLE	bool
STATIC_SCENE_DETECTION_SENSITIVITY	AMF_PA_STATIC_SCENE_DETECTION_SENSITIVITY_ENUM
INITIAL_QP_AFTER_SCENE_CHANGE	amf_uint64
MAX_QP_BEFORE_FORCE_SKIP	amf_uint64
CAQ_STRENGTH	AMF_PA_CAQ_STRENGTH_ENUM
FRAME_SAD_ENABLE	bool
LTR_ENABLE	bool
LOOKAHEAD_BUFFER_DEPTH	amf_uint64
PAQ_MODE	AMF_PA_PAQ_MODE_ENUM
TAQ_MODE	AMF_PA_TAQ_MODE_ENUM
HIGH_MOTION_QUALITY_BOOST_MODE	AMF_PA_HIGH_MOTION_QUALITY_BOOST_MODE_ENUM

Table 1. AMF PA properties in encoder mode

Name: ENGINE_TYPE

Values: AMF_MEMORY_DX11 , AMF_MEMORY_OPENCL

Default Value: AMF_MEMORY_OPENCL

Description: Determines what type of kernel PA uses.

Name: ACTIVITY_TYPE

Values: AMF_PA_ACTIVITY_Y , AMF_PA_ACTIVITY_YUV

Default Value: AMF_PA_ACTIVITY_Y

Description: Determines whether activity analysis is performed on the Luma component only (Y) or on both Luma and Chroma (YUV).

Name: SCENE_CHANGE_DETECTION_ENABLE

Values: true , false

Default Value: true

Description: Enables scene change detection.

Name: SCENE_CHANGE_DETECTION_SENSITIVITY

Values: AMF_PA_SCENE_CHANGE_DETECTION_SENSITIVITY_LOW , AMF_PA_SCENE_CHANGE_DETECTION_SENSITIVITY_MEDIUM , AMF_PA_SCENE_CHANGE_DETECTION_SENSITIVITY_HIGH

Default Value: AMF_PA_SCENE_CHANGE_DETECTION_SENSITIVITY_MEDIUM

Description: Sensitivity of scene change detection. The higher the sensitivity, the more restrictive it is to detect a scene change. This parameter takes effect only when AMF_PA_LOOKAHEAD_BUFFER_DEPTH is set to 0.

Name: STATIC_SCENE_DETECTION_ENABLE

Values: true , false

Default Value: false

Description: Enables static scene detection. A frame in a static scene will be encoded as a skip frame if the reference frame quality is acceptable. Refer to AMF_PA_MAX_QP_BEFORE_FORCE_SKIP for details.

Name: STATIC_SCENE_DETECTION_SENSITIVITY

Values: AMF_PA_STATIC_SCENE_DETECTION_SENSITIVITY_LOW , AMF_PA_STATIC_SCENE_DETECTION_SENSITIVITY_MEDIUM , AMF_PA_STATIC_SCENE_DETECTION_SENSITIVITY_HIGH

Default Value: AMF_PA_STATIC_SCENE_DETECTION_SENSITIVITY_HIGH

Description: Sensitivity of static scene detection. The higher the sensitivity, the more restrictive it is to detect a static scene.

Name: INITIAL_QP_AFTER_SCENE_CHANGE

Values: 0 - 51

Default Value: 0

Description: The QP value that is used immediately after a scene change. When this parameter value equals 0, PA will automatically calculate a QP value for the new scene.

Name: MAX_QP_BEFORE_FORCE_SKIP

Values: 0 - 51

Default Value: 35

Description: To maintain acceptable encoding quality, a static frame is allowed to be encoded as a skip frame only when the average QP value across the blocks of the previously-encoded frame is less than or equal to this value/threshold.

Name: CAQ_STRENGTH

Values: AMF_PA_CAQ_STRENGTH_LOW , AMF_PA_CAQ_STRENGTH_MEDIUM , AMF_PA_CAQ_STRENGTH_HIGH

Default Value: AMF_PA_CAQ_STRENGTH_MEDIUM

Description: Content Adaptive Quantization strength. Stronger CAQ strength means larger variation in block level QP assignment.

Name: FRAME_SAD_ENABLE

Values: true , false

Default Value: true

Description: Enables Frame SAD algorithm.

Name: LTR_ENABLE

Values: true , false

Default Value: false

Description: Enables automatic long term reference frame management. Last frame of a scene will be saved as LTR frame and used as reference when a similar frame occurs again.

Name: LOOKAHEAD_BUFFER_DEPTH

Values: 0 - MAX_LOOKAHEAD_DEPTH

Default Value associated with usages:

- Transcoding: 0
- Ultra low latency: 0
- Low latency: 0
- Webcam: 0
- HQ: 11
- HQLL: 0

Description: Sets the PA lookahead buffer size. The longer the buffer depth, the better the quality and the longer the latency.

Name: PAQ_MODE

Values: AMF_PA_PAQ_MODE_NONE , AMF_PA_PAQ_MODE_CAQ

Default Value: AMF_PA_PAQ_MODE_NONE

Description: Sets the perceptual adaptive quantization mode.

Name: TAQ_MODE

Values: AMF_PA_TAQ_MODE_NONE , AMF_PA_TAQ_MODE_1 , AMF_PA_TAQ_MODE_2

Default Value associated with usages:

- Transcoding: `AMF_PA_TAQ_MODE_NONE`
- Ultra low latency: `AMF_PA_TAQ_MODE_NONE`
- Low latency: `AMF_PA_TAQ_MODE_NONE`
- Webcam: `AMF_PA_TAQ_MODE_NONE`
- HQ: `AMF_PA_TAQ_MODE_2`
- HQLL: `AMF_PA_TAQ_MODE_NONE`

Description: Sets the temporal adaptive quantization mode. `MODE_1` is suitable for non-gaming applications whereas `MODE_2` is suitable for gaming applications.

Name: `HIGH_MOTION_QUALITY_BOOST_MODE`

Values: `AMF_PA_HIGH_MOTION_QUALITY_BOOST_MODE_NONE` , `AMF_PA_HIGH_MOTION_QUALITY_BOOST_MODE_AUTO`

Default Value associated with usages:

- Transcoding: `AMF_PA_HIGH_MOTION_QUALITY_BOOST_MODE_NONE`
- Ultra low latency: `AMF_PA_HIGH_MOTION_QUALITY_BOOST_MODE_NONE`
- Low latency: `AMF_PA_HIGH_MOTION_QUALITY_BOOST_MODE_NONE`
- Webcam: `AMF_PA_HIGH_MOTION_QUALITY_BOOST_MODE_NONE`
- HQ: `AMF_PA_HIGH_MOTION_QUALITY_BOOST_MODE_AUTO`
- HQLL: `AMF_PA_HIGH_MOTION_QUALITY_BOOST_MODE_NONE`

Description: Sets the PA high motion quality boost mode to help the encoder in motion search.

2.3 Sample Application

The TranscodeHW sample application in the SDK package illustrates how to setup and run AMF PA component in its encoder mode. It calculates the activity maps of the transcoder input and guides the succeeding encoding process. To enable the PA process in the encoder pipeline, use the command line parameter `-EnablePreAnalysis true` . Below is an example cmd line enabling PA:

```
TranscodeHW.exe -input input.mp4 -output output.mp4 -width 1920 -height 1080 -usage transcoding -qualitypreset quality -targetBitrate 5000000 -frames 1000 -engine dx11 -EnablePreAnalysis true
```

3 AMF PA - Standalone Mode

The standalone AMF PA component analyzes incoming video frames and produces an activity map for each video frame. Users also have the options to turn on the scene change detection and static scene detection features, in which cases AMF PA will return the scene change detection and/or static scene detection flags for the input frame.

3.1 Input / Output Format

The standalone AMF PA component accepts `AMF_SURFACE_R32` surfaces as input and produces activity maps also stored in `AMF_SURFACE_R32` surfaces. The resulting activity maps consist of one activity value (32-bit unsigned) for each 16x16 pixel block. The resulting activity map and scene change/static scene flags will be attached to the video frame structure.

3.2 Properties

Table 2 shows the available parameters in AMF PA standalone mode. The list underneath provides the detailed description of these parameters.

Name (prefix "AMF_PA_")	Type
ENGINE_TYPE	AMF_MEMORY_TYPE
ACTIVITY_TYPE	AMF_PA_ACTIVITY_TYPE_ENUM
SCENE_CHANGE_DETECTION_ENABLE	bool
SCENE_CHANGE_DETECTION_SENSITIVITY	AMF_PA_SCENE_CHANGE_DETECTION_SENSITIVITY_ENUM
STATIC_SCENE_DETECTION_ENABLE	bool
ACTIVITY_MAP	AMFSurface*
SCENE_CHANGE_DETECT	bool
STATIC_SCENE_DETECT	bool

Table 2. AMF PA properties in standalone mode

Name: ENGINE_TYPE

Values: AMF_MEMORY_DX11 , AMF_MEMORY_OPENCL

Default Value: AMF_MEMORY_OPENCL

Description: Determines what type of kernel PA uses.

Name: ACTIVITY_TYPE

Values: AMF_PA_ACTIVITY_Y , AMF_PA_ACTIVITY_YUV

Default Value: AMF_PA_ACTIVITY_Y

Description: Determines whether activity analysis is performed on the Luma component only (Y) or on both Luma and Chroma (YUV).

Name: SCENE_CHANGE_DETECTION_ENABLE

Values: true , false

Default Value: true

Description: Enables scene change detection.

Name: SCENE_CHANGE_DETECTION_SENSITIVITY

Values: AMF_PA_SCENE_CHANGE_DETECTION_SENSITIVITY_LOW , AMF_PA_SCENE_CHANGE_DETECTION_SENSITIVITY_MEDIUM , AMF_PA_SCENE_CHANGE_DETECTION_SENSITIVITY_HIGH

Default Value: AMF_PA_SCENE_CHANGE_DETECTION_SENSITIVITY_HIGH

Description: Sensitivity of scene change detection. The higher the sensitivity, the more restrictive it is to detect a scene change.

Name: STATIC_SCENE_DETECTION_ENABLE

Values: true , false

Default Value: false

Description: Enables static scene detection. A frame in a static scene will be encoded as a skip frame if the reference frame quality is acceptable. Refer to AMF_PA_MAX_QP_BEFORE_FORCE_SKIP for details.

Name: STATIC_SCENE_DETECTION_SENSITIVITY

Values: AMF_PA_STATIC_SCENE_DETECTION_SENSITIVITY_LOW , AMF_PA_STATIC_SCENE_DETECTION_SENSITIVITY_MEDIUM , AMF_PA_STATIC_SCENE_DETECTION_SENSITIVITY_HIGH

Default Value: AMF_PA_STATIC_SCENE_DETECTION_SENSITIVITY_MEDIUM

Description: Sensitivity of static scene detection. The higher the sensitivity, the more restrictive it is to detect a static scene.

Name: ACTIVITY_MAP

Values: int32

Default Value: N/A

Description: Activity map calculated for the input image where each value corresponds to one block. Properties set by PA on output buffer interface.

Name: SCENE_CHANGE_DETECT

Values: true , false

Default Value: N/A

Description: Scene change detection result. When this flag is true, it means the PA has identified the frame as a scene change. Properties set by PA on output buffer interface.

Name: STATIC_SCENE_DETECTION_SENSITIVITY

Values: true , false

Default Value: N/A

Description: Static scene detection result. When this flag is true, it means the PA has identified the frame as a static scene. Properties set by PA on output buffer interface.

3.3 Sample Application

The SimplePA sample application in the AMF SDK package illustrates how to setup and run AMF PA component in standalone mode. It calculates the activity maps of machine-generated video surfaces and dumps it into a binary file.

4 Annex A: Glossary of Acronyms

Acronym	Definition
AMF	Advanced Media Framework

Acronym	Definition
PA	Pre-Analysis
CAQ	Content Adaptive Quantization
PAQ	Perceptual Adaptive Quantization
TAQ	Temporal Adaptive Quantization
SAD	Sum of absolute difference
LTR	Long Term Reference
