The **URLEncoder** (p. 3894) and **URLDecoder** (p. 3893) classes can also be used, but only for HTML form encoding, which is not the same as the encoding scheme defined in RFC2396.

## 6.858.2 Constructor & Destructor Documentation

6.858.2.1 **decaf::net::URL::URL ( )**

6.858.2.2 **decaf::net::URL::URL ( const std::string & url )**

6.858.2.3 **virtual decaf::net::URL::~~URL ( )** [inline, virtual]

The documentation for this class was generated from the following file:

- src/main/decaf/net/**URL.h**

## 6.859 decaf::net::URLDecoder Class Reference

```
#include <src/main/decaf/net/URLDecoder.h>
```

### Public Member Functions

- virtual **~URLDecoder ( )**

### Static Public Member Functions

- static std::string **decode** (const std::string &value)

*Decodes the string argument which is assumed to be encoded in the x-www-form-urlencoded MIME content type.*

### 6.859.1 Constructor & Destructor Documentation

6.859.1.1 virtual decaf::net::URLDecoder::~~URLDecoder ( ) [inline, virtual]

### 6.859.2 Member Function Documentation

6.859.2.1 static std::string decaf::net::URLDecoder::decode ( const std::string & value )  
[static]

Decodes the string argument which is assumed to be encoded in the x-www-form-urlencoded MIME content type.

'+' will be converted to space, '%' and two following hex digit characters are converted to the equivalent byte value. All other characters are passed through unmodified.

e.g. "A+B+C %24%25" -> "A B C \$%"

#### Parameters

<i>value</i>	- string The encoded string.
--------------	------------------------------

#### Returns

The decoded version as a string.

The documentation for this class was generated from the following file:

- src/main/decaf/net/**URLDecoder.h**

## 6.860 decaf::net::URLEncoder Class Reference

```
#include <src/main/decaf/net/URLEncoder.h>
```

### Public Member Functions

- virtual ~**URLEncoder** ( )

### Static Public Member Functions

- static std::string **encode** (const std::string &value)

*This class contains a utility method for converting a string to the format required by the application/x-www-form-urlencoded MIME content type.*

### 6.860.1 Constructor & Destructor Documentation

6.860.1.1 virtual decaf::net::URLEncoder::~~URLEncoder ( ) [inline, virtual]

## 6.860.2 Member Function Documentation

6.860.2.1 `static std::string decaf::net::URLEncoder::encode ( const std::string & value )`  
`[static]`

This class contains a utility method for converting a string to the format required by the `application/x-www-form-urlencoded` MIME content type.

All characters except letters ('a'..'z', 'A'..'Z') and numbers ('0'..'9') and characters '.', '-', '\*', '\_' are converted into their hexadecimal value prepended by '%'.

For example: '#' -> '%23'

In addition, spaces are substituted by '+'

### Parameters

<code>value</code>	- the string to be converted
--------------------	------------------------------

### Returns

the converted string

The documentation for this class was generated from the following file:

- `src/main/decaf/net/URLEncoder.h`

## 6.861 activemq::util::Usage Class Reference

```
#include <src/main/activemq/util/Usage.h>
```

Inheritance diagram for `activemq::util::Usage`:

### Public Member Functions

- virtual `~Usage ()`
- virtual void `waitForSpace ()=0`  
*Waits forever for more space to be returned to this **Usage** (p. 3895) Manager.*
- virtual void `waitForSpace (unsigned int timeout)=0`  
*Waits for more space to be returned to this **Usage** (p. 3895) Manager, times out when the given time span in milliseconds elapses.*
- virtual void `enqueueUsage (unsigned long long value)=0`  
*Tries to increase the usage by value amount but blocks if this object is currently full.*
- virtual void `increaseUsage (unsigned long long value)=0`  
*Increases the usage by the value amount.*
- virtual void `decreaseUsage (unsigned long long value)=0`

*Decreases the usage by the value amount.*

- virtual bool **isFull** () const =0

*Returns true if this **Usage** (p. 3895) instance is full, i.e.*

## 6.861.1 Constructor & Destructor Documentation

6.861.1.1 virtual activemq::util::Usage::~Usage ( ) [inline, virtual]

## 6.861.2 Member Function Documentation

6.861.2.1 virtual void activemq::util::Usage::decreaseUsage ( unsigned long long value )  
[pure virtual]

Decreases the usage by the value amount.

### Parameters

<i>value</i>	Amount of space to return to the pool
--------------	---------------------------------------

Implemented in **activemq::util::MemoryUsage** (p. 2473).

6.861.2.2 virtual void activemq::util::Usage::enqueueUsage ( unsigned long long value )  
[pure virtual]

Tries to increase the usage by value amount but blocks if this object is currently full.

### Parameters

<i>value</i>	Amount of usage in bytes to add.
--------------	----------------------------------

Implemented in **activemq::util::MemoryUsage** (p. 2474).

6.861.2.3 virtual void activemq::util::Usage::increaseUsage ( unsigned long long value )  
[pure virtual]

Increases the usage by the value amount.

### Parameters

<i>value</i>	Amount of usage to add.
--------------	-------------------------

Implemented in **activemq::util::MemoryUsage** (p. 2474).

6.861.2.4 virtual bool activemq::util::Usage::isFull ( ) const [pure virtual]

Returns true if this **Usage** (p. 3895) instance is full, i.e.

**Usage** (p. 3895)  $\geq 100\%$

### Returns

true if **Usage** (p. 3895) is at the Full point.

Implemented in **activemq::util::MemoryUsage** (p. 2474).

**6.861.2.5** `virtual void activemq::util::Usage::waitForSpace ( unsigned int timeout ) [pure virtual]`

Waits for more space to be returned to this **Usage** (p. 3895) Manager, times out when the given time span in milliseconds elapses.

### Parameters

<i>timeout</i>	The time to wait for more space.
----------------	----------------------------------

Implemented in **activemq::util::MemoryUsage** (p. 2475).

**6.861.2.6** `virtual void activemq::util::Usage::waitForSpace ( ) [pure virtual]`

Waits forever for more space to be returned to this **Usage** (p. 3895) Manager.

Implemented in **activemq::util::MemoryUsage** (p. 2475).

The documentation for this class was generated from the following file:

- `src/main/activemq/util/Usage.h`

## 6.862 decaf::io::UTFDataFormatException Class Reference

Thrown from classes that attempt to read or write a UTF-8 encoded string and an encoding error is encountered.

```
#include <src/main/decaf/io/UTFDataFormatException.h>
```

Inheritance diagram for `decaf::io::UTFDataFormatException`:

### Public Member Functions

- **UTFDataFormatException** () throw ()  
*Default Constructor.*
- **UTFDataFormatException** (const **lang::Exception** &ex) throw ()  
*Copy Constructor.*

- **UTFDataFormatException** (const **UTFDataFormatException** &ex) throw ()  
*Copy Constructor.*
- **UTFDataFormatException** (const char \*file, const int lineNumber, const std::exception \*cause, const char \*msg,...) throw ()  
*Constructor - Initializes the file name and line number where this message occurred.*
- **UTFDataFormatException** (const std::exception \*cause) throw ()  
*Constructor.*
- **UTFDataFormatException** (const char \*file, const int lineNumber, const char \*msg,...) throw ()  
*Constructor.*
- virtual **UTFDataFormatException** \* **clone** () const  
*Clones this exception.*
- virtual ~**UTFDataFormatException** () throw ()

### 6.862.1 Detailed Description

Thrown from classes that attempt to read or write a UTF-8 encoded string and an encoding error is encountered.

#### Since

1.0

### 6.862.2 Constructor & Destructor Documentation

6.862.2.1 decaf::io::UTFDataFormatException::UTFDataFormatException ( ) throw ()  
[inline]

Default Constructor.

6.862.2.2 decaf::io::UTFDataFormatException::UTFDataFormatException ( const lang::Exception & ex ) throw () [inline]

Copy Constructor.

#### Parameters

ex	the exception to copy
----	-----------------------

6.862.2.3 decaf::io::UTFDataFormatException::UTFDataFormatException ( const UTFDataFormatException & ex ) throw () [inline]

Copy Constructor.

**Parameters**

<i>ex</i>	the exception to copy, which is an instance of this type
-----------	--

**6.862.2.4** `decaf::io::UTFDataFormatException::UTFDataFormatException ( const char * file,  
const int lineNumber, const std::exception * cause, const char * msg, ... ) throw ()`  
[inline]

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

**Parameters**

<i>file</i>	The file name where exception occurs
<i>lineNumber</i>	The line number where the exception occurred.
<i>cause</i>	The exception that was the cause for this one to be thrown.
<i>msg</i>	The message to report
...	list of primitives that are formatted into the message

**6.862.2.5** `decaf::io::UTFDataFormatException::UTFDataFormatException ( const std::exception  
* cause ) throw ()` [inline]

Constructor.

**Parameters**

<i>cause</i>	Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.
--------------	--

**6.862.2.6** `decaf::io::UTFDataFormatException::UTFDataFormatException ( const char * file,  
const int lineNumber, const char * msg, ... ) throw ()` [inline]

Constructor.

**Parameters**

<i>file</i>	The file name where exception occurs
<i>lineNumber</i>	The line number where the exception occurred.
<i>msg</i>	The message to report
...	list of primitives that are formatted into the message

**6.862.2.7** `virtual decaf::io::UTFDataFormatException::~~UTFDataFormatException ( ) throw ()`  
[inline, virtual]

### 6.862.3 Member Function Documentation

6.862.3.1 virtual **UTFDataFormatException\*** decaf::io::UTFDataFormatException::clone ( ) const [inline, virtual]

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

#### Returns

A new instance of an Exception object that is a copy of this instance.

Reimplemented from **decaf::io::IOException** (p. 2105).

The documentation for this class was generated from the following file:

- src/main/decaf/io/**UTFDataFormatException.h**

## 6.863 decaf::util::UUID Class Reference

A class that represents an immutable universally unique identifier (**UUID** (p. 3900)).

```
#include <src/main/decaf/util/UUID.h>
```

Inheritance diagram for decaf::util::UUID:

### Public Member Functions

- **UUID** (long long mostSigBits, long long leastSigBits)  
*Constructs a new **UUID** (p. 3900) using the specified data.*
- virtual **~UUID** ()
- virtual int **compareTo** (const **UUID** &value) const  
*Compare the given **UUID** (p. 3900) to this one.*
- virtual bool **equals** (const **UUID** &value) const  
*Compares this **UUID** (p. 3900) to the one given, returns true if they are equal.*
- virtual bool **operator==** (const **UUID** &value) const  
*Compares equality between this object and the one passed.*
- virtual bool **operator<** (const **UUID** &value) const  
*Compares this object to another and returns true if this object is considered to be less than the one passed.*
- virtual std::string **toString** () const  
*Returns a String object representing this **UUID** (p. 3900).*
- virtual long long **getLeastSignificantBits** () const

- virtual long long **getMostSignificantBits** () const
- virtual long long **node** () throw ( lang::exceptions::UnsupportedOperationException )  
*The node value associated with this **UUID** (p. 3900).*
- virtual long long **timestamp** () throw ( lang::exceptions::UnsupportedOperationException )  
*The timestamp value associated with this **UUID** (p. 3900).*
- virtual int **clockSequence** () throw ( lang::exceptions::UnsupportedOperationException )  
*The clock sequence value associated with this **UUID** (p. 3900).*
- virtual int **variant** () throw ( lang::exceptions::UnsupportedOperationException )  
*The variant number associated with this **UUID** (p. 3900).*
- virtual int **version** () throw ( lang::exceptions::UnsupportedOperationException )  
*The version number associated with this **UUID** (p. 3900).*

### Static Public Member Functions

- static **UUID randomUUID** ()  
*Static factory to retrieve a type 4 (pseudo randomly generated) **UUID** (p. 3900).*
- static **UUID nameUUIDFromBytes** (const std::vector< char > &name)  
*Static factory to retrieve a type 3 (name based) **UUID** (p. 3900) based on the specified byte array.*
- static **UUID nameUUIDFromBytes** (const char \*name, std::size\_t size)  
*Static factory to retrieve a type 3 (name based) **UUID** (p. 3900) based on the specified byte array.*
- static **UUID fromString** (const std::string &name) throw ( lang::exceptions::IllegalArgumentException )  
*Creates a **UUID** (p. 3900) from the string standard representation as described in the **toString()** (p. 3906) method.*

### 6.863.1 Detailed Description

A class that represents an immutable universally unique identifier (**UUID** (p. 3900)).

A **UUID** (p. 3900) represents a 128-bit value.

There exist different variants of these global identifiers. The methods of this class are for manipulating the Leach-Salz variant, although the constructors allow the creation of any variant of **UUID** (p. 3900) (described below).

The layout of a variant 2 (Leach-Salz) **UUID** (p. 3900) is as follows: The most significant long consists of the following unsigned fields:

```
0xFFFFFFFF00000000 time_low 0x00000000FFFF0000 time_mid 0x000000000000F000
version 0x000000000000FFF time_hi
```

The least significant long consists of the following unsigned fields:

0xC000000000000000 variant 0x3FFF000000000000 clock\_seq 0x0000FFFFFFFFFFFF node

The variant field contains a value which identifies the layout of the **UUID** (p. 3900). The bit layout described above is valid only for a **UUID** (p. 3900) with a variant value of 2, which indicates the Leach-Salz variant.

The version field holds a value that describes the type of this **UUID** (p. 3900). There are four different basic types of UUIDs: time-based, DCE security, name-based, and randomly generated UUIDs. These types have a version value of 1, 2, 3 and 4, respectively.

For more information including algorithms used to create UUIDs, see the Internet-Draft UUIDs and GUIDs or the standards body definition at ISO/IEC 11578:1996.

## 6.863.2 Constructor & Destructor Documentation

### 6.863.2.1 decaf::util::UUID::UUID ( long long *mostSigBits*, long long *leastSigBits* )

Constructs a new **UUID** (p. 3900) using the specified data.

*mostSigBits* is used for the most significant 64 bits of the **UUID** (p. 3900) and *leastSigBits* becomes the least significant 64 bits of the **UUID** (p. 3900).

#### Parameters

<i>mostSigBits</i>	
<i>leastSigBits</i>	

### 6.863.2.2 virtual decaf::util::UUID::~~UUID ( ) [virtual]

## 6.863.3 Member Function Documentation

### 6.863.3.1 virtual int decaf::util::UUID::clockSequence ( ) throw ( lang::exceptions::UnsupportedOperationException ) [virtual]

The clock sequence value associated with this **UUID** (p. 3900).

The 14 bit clock sequence value is constructed from the clock sequence field of this **UUID** (p. 3900). The clock sequence field is used to guarantee temporal uniqueness in a time-based **UUID** (p. 3900).

The *clockSequence* value is only meaningful in a time-based **UUID** (p. 3900), which has version type 1. If this **UUID** (p. 3900) is not a time-based **UUID** (p. 3900) then this method throws `UnsupportedOperationException`.

#### Returns

the *clockSequence* associated with a V1 **UUID** (p. 3900)

**Exceptions**

<i>UnsupportedOperationException</i>
--------------------------------------

6.863.3.2 `virtual int decaf::util::UUID::compareTo ( const UUID & value ) const`  
[virtual]

Compare the given **UUID** (p. 3900) to this one.

**Parameters**

<i>value</i>	- the <b>UUID</b> (p. 3900) to compare to
--------------	---

6.863.3.3 `virtual bool decaf::util::UUID::equals ( const UUID & value ) const` [virtual]

Compares this **UUID** (p. 3900) to the one given, returns true if they are equal.

**Parameters**

<i>value</i>	- the <b>UUID</b> (p. 3900) to compare to.
--------------	--

**Returns**

true if UUIDs are the same.

6.863.3.4 `static UUID decaf::util::UUID::fromString ( const std::string & name ) throw (`  
`lang::exceptions::IllegalArgumentException )` [static]

Creates a **UUID** (p. 3900) from the string standard representation as described in the **toString()** (p. 3906) method.

**Parameters**

<i>name</i>	- a string to be used to construct a <b>UUID</b> (p. 3900).
-------------	---

**Returns**

type 3 **UUID** (p. 3900)

6.863.3.5 `virtual long long decaf::util::UUID::getLeastSignificantBits ( ) const` [virtual]

**Returns**

the most significant 64 bits of this UUID's 128 bit value.

6.863.3.6 virtual long long decaf::util::UUID::getMostSignificantBits ( ) const [virtual]

#### Returns

the most significant 64 bits of this UUID's 128 bit value.

6.863.3.7 static **UUID** decaf::util::UUID::nameUUIDFromBytes ( const std::vector< char > & name ) [static]

Static factory to retrieve a type 3 (name based) **UUID** (p. 3900) based on the specified byte array.

#### Parameters

<i>name</i>	- a byte array to be used to construct a <b>UUID</b> (p. 3900).
-------------	---

#### Returns

type 3 **UUID** (p. 3900)

6.863.3.8 static **UUID** decaf::util::UUID::nameUUIDFromBytes ( const char \* name, std::size\_t size ) [static]

Static factory to retrieve a type 3 (name based) **UUID** (p. 3900) based on the specified byte array.

#### Parameters

<i>name</i>	- a byte array to be used to construct a <b>UUID</b> (p. 3900).
<i>size</i>	- the size of the byte array, or number of bytes to use.

#### Returns

type 3 **UUID** (p. 3900)

6.863.3.9 virtual long long decaf::util::UUID::node ( ) throw ( lang::exceptions::UnsupportedOperationException ) [virtual]

The node value associated with this **UUID** (p. 3900).

The 48 bit node value is constructed from the node field of this **UUID** (p. 3900). This field is intended to hold the IEEE 802 address of the machine that generated this **UUID** (p. 3900) to guarantee spatial uniqueness.

The node value is only meaningful in a time-based **UUID** (p. 3900), which has version type 1. If this **UUID** (p. 3900) is not a time-based **UUID** (p. 3900) then this method throws UnsupportedOperationException.

**Returns**

the node value of this **UUID** (p. 3900)

**Exceptions**

<i>UnsupportedOperation</i> <i>Exception</i>
---

**6.863.3.10** `virtual bool decaf::util::UUID::operator< ( const UUID & value ) const`  
[virtual]

Compares this object to another and returns true if this object is considered to be less than the one passed.

This

**Parameters**

<i>value</i>	- the value to be compared to this one.
--------------	---

**Returns**

true if this object is equal to the one passed.

**6.863.3.11** `virtual bool decaf::util::UUID::operator== ( const UUID & value ) const`  
[virtual]

Compares equality between this object and the one passed.

**Parameters**

<i>value</i>	- the value to be compared to this one.
--------------	---

**Returns**

true if this object is equal to the one passed.

**6.863.3.12** `static UUID decaf::util::UUID::randomUUID ( )` [static]

Static factory to retrieve a type 4 (pseudo randomly generated) **UUID** (p. 3900).

The **UUID** (p. 3900) is generated using a cryptographically strong pseudo random number generator.

**Returns**

type 4 **UUID** (p. 3900)

6.863.3.13 `virtual long long decaf::util::UUID::timestamp ( ) throw ( lang::exceptions::UnsupportedOperationException ) [virtual]`

The timestamp value associated with this **UUID** (p. 3900).

The 60 bit timestamp value is constructed from the `time_low`, `time_mid`, and `time_hi` fields of this **UUID** (p. 3900). The resulting timestamp is measured in 100-nanosecond units since midnight, October 15, 1582 UTC.

The timestamp value is only meaningful in a time-based **UUID** (p. 3900), which has version type 1. If this **UUID** (p. 3900) is not a time-based **UUID** (p. 3900) then this method throws `UnsupportedOperationException`.

#### Returns

the timestamp associated with a V1 **UUID** (p. 3900)

#### Exceptions

<i>UnsupportedOperationException</i>	
--------------------------------------	--

6.863.3.14 `virtual std::string decaf::util::UUID::toString ( ) const [virtual]`

Returns a `String` object representing this **UUID** (p. 3900).

UUID's are formatted as: 00112233-4455-6677-8899-AABBCCDDEEFF whose length is 36.

#### Returns

formatted string for this **UUID** (p. 3900)

6.863.3.15 `virtual int decaf::util::UUID::variant ( ) throw ( lang::exceptions::UnsupportedOperationException ) [virtual]`

The variant number associated with this **UUID** (p. 3900).

The variant number describes the layout of the **UUID** (p. 3900). The variant number has the following meaning:

\* 0 Reserved for NCS backward compatibility \* 2 The Leach-Salz variant (used by this class) \* 6 Reserved, Microsoft Corporation backward compatibility \* 7 Reserved for future definition

#### Returns

the variant associated with a V1 **UUID** (p. 3900)

#### Exceptions

<i>UnsupportedOperationException</i>	
--------------------------------------	--

6.863.3.16 `virtual int decaf::util::UUID::version ( ) throw ( lang::exceptions::UnsupportedOperationException ) [virtual]`

The version number associated with this **UUID** (p. 3900).

The version number describes how this **UUID** (p. 3900) was generated. The version number has the following meaning:

\* 1 Time-based **UUID** (p. 3900) \* 2 DCE security **UUID** (p. 3900) \* 3 Name-based **UUID** (p. 3900) \* 4 Randomly generated **UUID** (p. 3900)

### Returns

the version associated with a V1 **UUID** (p. 3900)

### Exceptions

<i>UnsupportedOperationException</i>
--------------------------------------

The documentation for this class was generated from the following file:

- src/main/decaf/util/**UUID.h**

## 6.864 activemq::wireformat::WireFormat Class Reference

Provides a mechanism to marshal commands into and out of packets or into and out of streams, Channels and Datagrams.

```
#include <src/main/activemq/wireformat/WireFormat.h>
```

Inheritance diagram for activemq::wireformat::WireFormat:

### Public Member Functions

- virtual **~WireFormat** ()
- virtual void **marshal** (const **Pointer**< **commands::Command** > &command, const **activemq::transport::Transport** \*transport, **decaf::io::DataOutputStream** \*out)=0 throw ( **decaf::io::IOException** )

- virtual bool **inReceive** () const =0  
*Indicates if the WireFormat object is in the process of receiving a message.*
- virtual **Pointer**< **transport::Transport** > **createNegotiator** (const **Pointer**< **transport::Transport** > &transport)=0 throw ( decaf::lang::exceptions::UnsupportedOperationException )  
*If the Transport Provides a Negotiator this method will create and return a new instance of the Negotiator.*

### 6.864.1 Detailed Description

Provides a mechanism to marshal commands into and out of packets or into and out of streams, Channels and Datagrams.

#### Version

#### Revision:

1.1

### 6.864.2 Constructor & Destructor Documentation

6.864.2.1 virtual activemq::wireformat::WireFormat::~WireFormat ( ) [inline, virtual]

### 6.864.3 Member Function Documentation

6.864.3.1 virtual **Pointer**<transport::Transport> activemq::wireformat::WireFormat::createNegotiator ( const **Pointer**< transport::Transport > & transport ) throw ( decaf::lang::exceptions::UnsupportedOperationException ) [pure virtual]

If the Transport Provides a Negotiator this method will create and return a new instance of the Negotiator.

#### Parameters

<i>transport</i>	- the Transport to Wrap the Negotiator around.
------------------	--

**Returns**

new instance of a **WireFormatNegotiator** (p. 3946) as a **Pointer<Transport>** (p. 2896).

**Exceptions**

<i>UnsupportedOperationException</i>	if the <b>WireFormat</b> (p. 3907) doesn't have a Negotiator.
--------------------------------------	---

Implemented in **activemq::wireformat::openwire::OpenWireFormat** (p. 2840), and **activemq::wireformat::stomp::StompWireFormat** (p. 3587).

6.864.3.2 `virtual int activemq::wireformat::WireFormat::getVersion ( ) const` [pure virtual]

Get the Version.

**Returns**

the version of the wire format

Implemented in **activemq::wireformat::openwire::OpenWireFormat** (p. 2842), and **activemq::wireformat::stomp::StompWireFormat** (p. 3587).

6.864.3.3 `virtual bool activemq::wireformat::WireFormat::hasNegotiator ( ) const` [pure virtual]

Returns true if this **WireFormat** (p. 3907) has a Negotiator that needs to wrap the Transport that uses it.

**Returns**

true if the **WireFormat** (p. 3907) provides a Negotiator.

Implemented in **activemq::wireformat::openwire::OpenWireFormat** (p. 2842), and **activemq::wireformat::stomp::StompWireFormat** (p. 3587).

6.864.3.4 `virtual bool activemq::wireformat::WireFormat::inReceive ( ) const` [pure virtual]

Indicates if the WireFormat object is in the process of receiving a message.

This is useful for monitoring inactivity and the **WireFormat** (p. 3907) is processing a large message which takes longer than some configured timeout to unmarshal, the inactivity monitor can query the **WireFormat** (p. 3907) instance to determine if its busy or not and not mark the connection as inactive if so.

**Returns**

true if the **WireFormat** (p. 3907) object is unmarshaling a message.

Implemented in **activemq::wireformat::openwire::OpenWireFormat** (p. 2842), and **activemq::wireformat::stomp::StompWireFormat** (p. 3588).

6.864.3.5 `virtual void activemq::wireformat::WireFormat::marshal ( const Pointer< commands::Command > & command, const activemq::transport::Transport * transport, decaf::io::DataOutputStream * out ) throw ( decaf::io::IOException ) [pure virtual]`

Stream based marshaling of a Command, this method blocks until the entire Command has been written out to the output stream.

#### Parameters

<i>command</i>	The Command to Marshal
<i>transport</i>	The Transport that called this method.
<i>out</i>	The output stream to write the command to.

#### Exceptions

<i>IOException</i>	
--------------------	--

Implemented in **activemq::wireformat::openwire::OpenWireFormat** (p. 2844), and **activemq::wireformat::stomp::StompWireFormat** (p. 3588).

6.864.3.6 `virtual void activemq::wireformat::WireFormat::setVersion ( int version ) [pure virtual]`

Set the Version.

#### Parameters

<i>version</i>	the version of the wire format
----------------	--------------------------------

Implemented in **activemq::wireformat::openwire::OpenWireFormat** (p. 2847), and **activemq::wireformat::stomp::StompWireFormat** (p. 3588).

6.864.3.7 `virtual Pointer<commands::Command> activemq::wireformat::WireFormat::unmarshal ( const activemq::transport::Transport * transport, decaf::io::DataInputStream * in ) throw ( decaf::io::IOException ) [pure virtual]`

Stream based unmarshaling, blocks on reads on the input stream until a complete command has been read and unmarshaled into the correct form.

Returns a Pointer to the newly unmarshaled Command.

#### Parameters

<i>transport</i>	- Pointer to the transport that is making this request.
<i>in</i>	- the input stream to read the command from.

**Returns**

the newly marshaled Command, caller owns the pointer

**Exceptions**

<i>IOException</i>
--------------------

Implemented in **activemq::wireformat::openwire::OpenWireFormat** (p. 2849), and **activemq::wireformat::stomp::StompWireFormat** (p. 3589).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/**WireFormat.h**

## 6.865 activemq::wireformat::WireFormatFactory Class Reference

The **WireFormatFactory** (p. 3911) is the interface that all **WireFormatFactory** (p. 3911) classes must extend.

```
#include <src/main/activemq/wireformat/WireFormatFactory.h>
```

Inheritance diagram for activemq::wireformat::WireFormatFactory:

**Public Member Functions**

- virtual **~WireFormatFactory** ()
- virtual **Pointer< WireFormat > createWireFormat** (const **decaf::util::Properties** &properties)=0 throw ( **decaf::lang::exceptions::IllegalStateException** )

*Creates a new **WireFormat** (p. 3907) Object passing it a set of properties from which it can obtain any optional settings.*

### 6.865.1 Detailed Description

The **WireFormatFactory** (p. 3911) is the interface that all **WireFormatFactory** (p. 3911) classes must extend.

The Factory creates a **WireFormat** (p. 3907) Object based on the properties that are set in the passed **Properties** object.

### 6.865.2 Constructor & Destructor Documentation

- 6.865.2.1 **virtual activemq::wireformat::WireFormatFactory::~WireFormatFactory** ( )  
[inline, virtual]

### 6.865.3 Member Function Documentation

6.865.3.1 virtual **Pointer**<**WireFormat**> **activemq::wireformat::WireFormatFactory::createWireFormat** ( const **decaf::util::Properties** & *properties* ) throw ( **decaf::lang::exceptions::IllegalStateException** ) [pure virtual]

Creates a new **WireFormat** (p. 3907) Object passing it a set of properties from which it can obtain any optional settings.

#### Parameters

<i>properties</i>	- the Properties for this <b>WireFormat</b> (p. 3907)
-------------------	---

#### Returns

Pointer to a new instance of a **WireFormat** (p. 3907) object.

Implemented in **activemq::wireformat::openwire::OpenWireFormatFactory** (p. 2850), and **activemq::wireformat::stomp::StompWireFormatFactory** (p. 3590).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/**WireFormatFactory.h**

## 6.866 activemq::commands::WireFormatInfo Class Reference

## 6.866.1 Constructor & Destructor Documentation

6.866.1.1 **activemq::commands::WireFormatInfo::WireFormatInfo** ( )

6.866.1.2 **virtual activemq::commands::WireFormatInfo::~WireFormatInfo** ( ) [virtual]

## 6.866.2 Member Function Documentation

6.866.2.1 **virtual void activemq::commands::WireFormatInfo::afterUnmarshal** ( **wireformat::WireFormat** \*wireFormat AMQCPP\_UNUSED ) throw ( decaf::io::IOException ) [virtual]

Called after unmarshaling is started to cleanup the object being unmarshaled.

**Parameters**

<i>wireFormat</i>	- the wireformat object to control unmarshaling
-------------------	---

Reimplemented from **activemq::commands::BaseDataStructure** (p. 794).

```
6.866.2.2  virtual void activemq::commands::WireFormatInfo::beforeMarshal (
            wireformat::WireFormat *wireFormat AMQCPP_UNUSED ) throw (
            decaf::io::IOException ) [virtual]
```

Handles the marshaling of the objects properties into the internal byte array before the object is marshalled to the wire.

**Parameters**

<i>wireFormat</i>	- the wire formatting controller
-------------------	----------------------------------

Reimplemented from **activemq::commands::BaseDataStructure** (p. 794).

```
6.866.2.3  virtual DataStructure* activemq::commands::WireFormatInfo::cloneDataStructure (
            ) const [virtual]
```

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

**Returns**

new copy of this object.

Implements **activemq::commands::DataStructure** (p. 1628).

```
6.866.2.4  virtual void activemq::commands::WireFormatInfo::copyDataStructure ( const
            DataStructure * src ) [virtual]
```

Copy the contents of the passed object into this objects members, overwriting any existing data.

**Returns**

src - Source Object

Reimplemented from **activemq::commands::BaseCommand** (p. 724).

```
6.866.2.5  virtual bool activemq::commands::WireFormatInfo::equals ( const DataStructure *
            value ) const [virtual]
```

Compares the **DataStructure** (p. 1628) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

### Returns

true if DataStructure's are Equal.

Reimplemented from **activemq::commands::BaseCommand** (p. 725).

6.866.2.6 `int activemq::commands::WireFormatInfo::getCacheSize ( ) const`

Gets the Cache Size setting.

### Returns

currently set cache size.

6.866.2.7 `virtual unsigned char activemq::commands::WireFormatInfo::getDataStructureType ( ) const [virtual]`

Get the unique identifier that this object and its own Marshaler share.

### Returns

new **DataStructure** (p. 1628) type copy.

Implements **activemq::commands::DataStructure** (p. 1631).

6.866.2.8 `const std::vector<unsigned char>& activemq::commands::WireFormatInfo::getMagic ( ) const [inline]`

Get the Magic field.

### Returns

const reference to a `std::vector<char>`

6.866.2.9 `const std::vector<unsigned char>& activemq::commands::WireFormatInfo::getMarshaledProperties ( ) const [inline]`

Get the marshalledProperties field.

### Returns

const reference to a `std::vector<char>`

6.866.2.10 `long long activemq::commands::WireFormatInfo::getMaxInactivityDuration ( ) const`

Returns the currently configured Max Inactivity duration.

#### Returns

the set inactivity duration value.

6.866.2.11 `long long activemq::commands::WireFormatInfo::getMaxInactivityDurationInitialDelay ( ) const`

Returns the currently configured Max Inactivity Initial Delay duration.

#### Returns

the set inactivity duration initial delay value.

6.866.2.12 `virtual util::PrimitiveMap& activemq::commands::WireFormatInfo::getProperties ( ) [inline, virtual]`

Gets the Properties for this **Command** (p. 1165).

#### Returns

the Properties object for this **Command** (p. 1165).

6.866.2.13 `virtual const util::PrimitiveMap& activemq::commands::WireFormatInfo::getProperties ( ) const [inline, virtual]`

Gets the Properties for this **Command** (p. 1165).

#### Returns

the Properties object for this **Command** (p. 1165).

6.866.2.14 `int activemq::commands::WireFormatInfo::getVersion ( ) const [inline]`

Get the current Wireformat Version.

#### Returns

int that identifies the version

6.866.2.15 `bool activemq::commands::WireFormatInfo::isCacheEnabled ( ) const`

Checks if the cacheEnabled flag is on.

#### Returns

true if the flag is on.

6.866.2.16 `virtual bool activemq::commands::WireFormatInfo::isMarshalAware ( ) const`  
`[inline, virtual]`

Indicates that this command is aware of Marshaling, and needs to have its Marshaling methods invoked.

#### Returns

boolean indicating desire to be in marshaling stages

Reimplemented from **activemq::commands::BaseDataStructure** (p. 796).

6.866.2.17 `bool activemq::commands::WireFormatInfo::isSizePrefixDisabled ( ) const`

Checks if the sizePrefixDisabled flag is on.

#### Returns

true if the flag is on.

6.866.2.18 `bool activemq::commands::WireFormatInfo::isStackTraceEnabled ( ) const`

Checks if the stackTraceEnabled flag is on.

#### Returns

true if the flag is on.

6.866.2.19 `bool activemq::commands::WireFormatInfo::isTcpNoDelayEnabled ( ) const`

Checks if the tcpNoDelayEnabled flag is on.

#### Returns

true if the flag is on.

6.866.2.20 `bool activemq::commands::WireFormatInfo::isTightEncodingEnabled ( ) const`

Checks if the `tightEncodingEnabled` flag is on.

#### Returns

true if the flag is on.

6.866.2.21 `bool activemq::commands::WireFormatInfo::isValid ( ) const`

Determines if we think this is a Valid **WireFormatInfo** (p. 3912) command.

#### Returns

true if its valid.

6.866.2.22 `virtual bool activemq::commands::WireFormatInfo::isWireFormatInfo ( ) const`  
[inline, virtual]

#### Returns

answers true to the `isWireFormatInfo` query

Reimplemented from **activemq::commands::BaseCommand** (p. 729).

6.866.2.23 `void activemq::commands::WireFormatInfo::setCacheEnabled ( bool cacheEnabled )`

Sets if the `cacheEnabled` flag is on.

#### Parameters

<i>cacheEnabled</i>	- true to turn flag is on
---------------------	---------------------------

6.866.2.24 `void activemq::commands::WireFormatInfo::setCacheSize ( int value )`

Sets the Cache Size setting.

#### Parameters

<i>value</i>	- value to set to the cache size.
--------------	-----------------------------------

6.866.2.25 void activemq::commands::WireFormatInfo::setMagic ( const std::vector< unsigned char > & *magic* ) [inline]

Sets the value of the magic field.

#### Parameters

<i>magic</i>	- const std::vector<char>
--------------	---------------------------

6.866.2.26 void activemq::commands::WireFormatInfo::setMarshaledProperties ( const std::vector< unsigned char > & *marshalledProperties* ) [inline]

Sets the value of the marshalledProperties field.

#### Parameters

<i>marshalled-Properties</i>	The Byte Array vector that contains the marshaled form of the <b>Message</b> (p. 2475) properties, this is the data sent over the wire.
------------------------------	---

6.866.2.27 void activemq::commands::WireFormatInfo::setMaxInactivityDuration ( long long *maxInactivityDuration* )

Sets the Max inactivity duration value.

#### Parameters

<i>maxInactivityDuration</i>	- max time a client can be inactive.
------------------------------	--------------------------------------

6.866.2.28 void activemq::commands::WireFormatInfo::setMaxInactivityDurationInitalDelay ( long long *maxInactivityDurationInitalDelay* )

Sets the Max inactivity initial delay duration value.

#### Parameters

<i>maxInactivityDurationInitalDelay</i>	- time before the inactivity delay is checked.
---	--

6.866.2.29 virtual void activemq::commands::WireFormatInfo::setProperties ( const util::PrimitiveMap & *map* ) [inline, virtual]

Sets the Properties for this **Command** (p. 1165).

**Parameters**

<i>map</i>	- PrimitiveMap to copy
------------	------------------------

6.866.2.30 `void activemq::commands::WireFormatInfo::setSizePrefixDisabled ( bool  
sizePrefixDisabled )`

Sets if the sizePrefixDisabled flag is on.

**Parameters**

<i>sizePre- fixDisabled</i>	- true to turn flag is on
---------------------------------	---------------------------

6.866.2.31 `void activemq::commands::WireFormatInfo::setStackTraceEnabled ( bool  
stackTraceEnabled )`

Sets if the stackTraceEnabled flag is on.

**Parameters**

<i>stack- TraceEn- abled</i>	- ture to turn flag is on
--------------------------------------	---------------------------

6.866.2.32 `void activemq::commands::WireFormatInfo::setTcpNoDelayEnabled ( bool  
tcpNoDelayEnabled )`

Sets if the tcpNoDelayEnabled flag is on.

**Parameters**

<i>tcpNoDe- layEnabled</i>	- ture to turn flag is on
--------------------------------	---------------------------

6.866.2.33 `void activemq::commands::WireFormatInfo::setTightEncodingEnabled ( bool  
tightEncodingEnabled )`

Sets if the tightEncodingEnabled flag is on.

**Parameters**

<i>tightEn- codingEn- abled</i>	- true to turn flag is on
---	---------------------------

6.866.2.34 `void activemq::commands::WireFormatInfo::setVersion ( int version )`  
[inline]

Set the current Wireformat Version.

#### Parameters

<i>version</i>	- int that identifies the version
----------------	-----------------------------------

6.866.2.35 `virtual std::string activemq::commands::WireFormatInfo::toString ( ) const`  
[virtual]

Returns a string containing the information for this **DataStructure** (p. 1628) such as its type and value of its elements.

#### Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::BaseCommand** (p. 729).

6.866.2.36 `virtual decaf::lang::Pointer<commands::Command>`  
`activemq::commands::WireFormatInfo::visit (`  
`activemq::state::CommandVisitor * visitor ) throw (`  
`exceptions::ActiveMQException )` [virtual]

Allows a Visitor to visit this command and return a response to the command based on the command type being visited.

The command will call the proper processXXX method in the visitor.

#### Returns

a **Response** (p. 3227) to the visitor being called or NULL if no response.

Implements **activemq::commands::Command** (p. 1170).

### 6.866.3 Field Documentation

### 6.867.1 Detailed Description

Marshaling code for Open Wire Format for **WireFormatInfoMarshaller** (p. 3923).

NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

## 6.867.2 Constructor & Destructor Documentation

6.867.2.1 `activemq::wireformat::openwire::marshal::v5::WireFormatInfoMarshaller::WireFormatInfoMarshaller ( ) [inline]`

6.867.2.2 `virtual activemq::wireformat::openwire::marshal::v5::WireFormatInfoMarshaller::~~WireFormatInfoMarshaller ( ) [inline, virtual]`

## 6.867.3 Member Function Documentation

6.867.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v5::WireFormatInfoMarshaller::createObject ( ) const [virtual]`

Creates a new instance of this marshalable type.

### Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1578).

6.867.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v5::WireFormatInfoMarshaller::getDataStructureType ( ) const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

### Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1585).

6.867.3.3 `virtual void activemq::wireformat::openwire::marshal::v5::WireFormatInfoMarshaller::looseMarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut ) throw ( decaf::io::IOException ) [virtual]`

Write a object instance to data output stream.

### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1591).

```
6.867.3.4  virtual void activemq::wireformat::openwire::marshal::v5::WireFormatInfoMarshaller::looseUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure,
  decaf::io::DataInputStream * dataIn ) throw ( decaf::io::IOException )
[virtual]
```

Un-marshal an object instance from the data input stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

**Exceptions**

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1599).

```
6.867.3.5  virtual int activemq::wireformat::openwire::marshal::v5::WireFormatInfoMarshaller::tightMarshal1
( OpenWireFormat * wireFormat, commands::DataStructure *
  dataStructure, utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write the booleans that this object uses to a BooleanStream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

**Returns**

int value indicating the size of the marshaled object.

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1606).

6.867.3.6 virtual void activemq::wireformat::openwire::marshal::v5::WireFormatInfoMarshaller::tightMarshal2  
 ( OpenWireFormat \* *wireFormat*, commands::DataStructure \* *dataStructure*,  
 decaf::io::DataOutputStream \* *dataOut*, utils::BooleanStream \* *bs* ) throw  
 ( decaf::io::IOException ) [virtual]

Write a object instance to data output stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

#### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1613).

6.867.3.7 virtual void activemq::wireformat::openwire::marshal::v5::WireFormatInfoMarshaller::tightUnmarshal  
 ( OpenWireFormat \* *wireFormat*, commands::DataStructure \*  
*dataStructure*, decaf::io::DataInputStream \* *dataIn*, utils::BooleanStream \*  
*bs* ) throw ( decaf::io::IOException ) [virtual]

Un-marshal an object instance from the data input stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

#### Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1620).

The documentation for this class was generated from the following file:

### 6.868.1 Detailed Description

Marshaling code for Open Wire Format for **WireFormatInfoMarshaller** (p. 3927).

NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

## 6.868.2 Constructor & Destructor Documentation

6.868.2.1 `activemq::wireformat::openwire::marshal::v6::WireFormatInfoMarshaller::WireFormatInfoMarshaller ( ) [inline]`

6.868.2.2 `virtual activemq::wireformat::openwire::marshal::v6::WireFormatInfoMarshaller::~~WireFormatInfoMarshaller ( ) [inline, virtual]`

## 6.868.3 Member Function Documentation

6.868.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v6::WireFormatInfoMarshaller::createObject ( ) const [virtual]`

Creates a new instance of this marshalable type.

### Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1578).

6.868.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v6::WireFormatInfoMarshaller::getDataStructureType ( ) const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

### Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1585).

6.868.3.3 `virtual void activemq::wireformat::openwire::marshal::v6::WireFormatInfoMarshaller::looseMarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut ) throw ( decaf::io::IOException ) [virtual]`

Write a object instance to data output stream.

### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1591).

```
6.868.3.4  virtual void activemq::wireformat::openwire::marshal::v6::WireFormatInfoMarshaller::looseUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure,
  decaf::io::DataInputStream * dataIn ) throw ( decaf::io::IOException )
[virtual]
```

Un-marshal an object instance from the data input stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

**Exceptions**

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1599).

```
6.868.3.5  virtual int activemq::wireformat::openwire::marshal::v6::WireFormatInfoMarshaller::tightMarshal1
( OpenWireFormat * wireFormat, commands::DataStructure *
  dataStructure, utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write the booleans that this object uses to a BooleanStream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

**Returns**

int value indicating the size of the marshaled object.

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1606).

## 6.868 activemq::wireformat::openwire::marshal::v6::WireFormatInfoMarshaller

### Class Reference 3943

6.868.3.6 virtual void activemq::wireformat::openwire::marshal::v6::WireFormatInfoMarshaller::tightMarshal2  
( OpenWireFormat \* *wireFormat*, commands::DataStructure \* *dataStructure*,  
decaf::io::DataOutputStream \* *dataOut*, utils::BooleanStream \* *bs* ) throw  
( decaf::io::IOException ) [virtual]

Write a object instance to data output stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

#### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1613).

6.868.3.7 virtual void activemq::wireformat::openwire::marshal::v6::WireFormatInfoMarshaller::tightUnmarshal  
( OpenWireFormat \* *wireFormat*, commands::DataStructure \*  
*dataStructure*, decaf::io::DataInputStream \* *dataIn*, utils::BooleanStream \*  
*bs* ) throw ( decaf::io::IOException ) [virtual]

Un-marshal an object instance from the data input stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

#### Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1620).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v6/**WireFormatInfoMarshaller.h**

## 6.869 activemq::wireformat::openwire::marshal::v2::WireFormatInfoMarshaller Class Reference

Marshaling code for Open Wire Format for **WireFormatInfoMarshaller** (p. 3931).

```
#include <src/main/activemq/wireformat/openwire/marshal/v2/WireFormatInfoMarshaller.h>
```

### 6.869.1 Detailed Description

Marshaling code for Open Wire Format for **WireFormatInfoMarshaller** (p. 3931).

NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

## 6.869.2 Constructor & Destructor Documentation

6.869.2.1 `activemq::wireformat::openwire::marshal::v2::WireFormatInfoMarshaller::WireFormatInfoMarshaller ( ) [inline]`

6.869.2.2 `virtual activemq::wireformat::openwire::marshal::v2::WireFormatInfoMarshaller::~~WireFormatInfoMarshaller ( ) [inline, virtual]`

## 6.869.3 Member Function Documentation

6.869.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::WireFormatInfoMarshaller::createObject ( ) const [virtual]`

Creates a new instance of this marshalable type.

### Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1578).

6.869.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v2::WireFormatInfoMarshaller::getDataStructureType ( ) const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

### Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1585).

6.869.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::WireFormatInfoMarshaller::looseMarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut ) throw ( decaf::io::IOException ) [virtual]`

Write a object instance to data output stream.

### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1591).

```
6.869.3.4  virtual void activemq::wireformat::openwire::marshal::v2::WireFormatInfoMarshaller::looseUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure,
  decaf::io::DataInputStream * dataIn ) throw ( decaf::io::IOException )
[virtual]
```

Un-marshal an object instance from the data input stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

**Exceptions**

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1599).

```
6.869.3.5  virtual int activemq::wireformat::openwire::marshal::v2::WireFormatInfoMarshaller::tightMarshal1
( OpenWireFormat * wireFormat, commands::DataStructure *
  dataStructure, utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write the booleans that this object uses to a BooleanStream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

**Returns**

int value indicating the size of the marshaled object.

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1606).

## 6.869 activemq::wireformat::openwire::marshal::v2::WireFormatInfoMarshaller

### Class Reference 3947

6.869.3.6 virtual void activemq::wireformat::openwire::marshal::v2::WireFormatInfoMarshaller::tightMarshal2  
( OpenWireFormat \* *wireFormat*, commands::DataStructure \* *dataStructure*,  
decaf::io::DataOutputStream \* *dataOut*, utils::BooleanStream \* *bs* ) throw  
( decaf::io::IOException ) [virtual]

Write a object instance to data output stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

#### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1613).

6.869.3.7 virtual void activemq::wireformat::openwire::marshal::v2::WireFormatInfoMarshaller::tightUnmarshal  
( OpenWireFormat \* *wireFormat*, commands::DataStructure \*  
*dataStructure*, decaf::io::DataInputStream \* *dataIn*, utils::BooleanStream \*  
*bs* ) throw ( decaf::io::IOException ) [virtual]

Un-marshal an object instance from the data input stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

#### Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1620).

The documentation for this class was generated from the following file:

```
6.870.3.5  virtual int activemq::wireformat::openwire::marshal::v4::WireFormatInfoMarshaller::tightMarshal1
( OpenWireFormat * wireFormat, commands::DataStructure *
  dataStructure, utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write the booleans that this object uses to a BooleanStream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

**Returns**

int value indicating the size of the marshaled object.

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1606).

## 6.870 activemq::wireformat::openwire::marshal::v4::WireFormatInfoMarshaller

### Class Reference 3951

6.870.3.6 virtual void activemq::wireformat::openwire::marshal::v4::WireFormatInfoMarshaller::tightMarshal2  
( OpenWireFormat \* *wireFormat*, commands::DataStructure \* *dataStructure*,  
decaf::io::DataOutputStream \* *dataOut*, utils::BooleanStream \* *bs* ) throw  
( decaf::io::IOException ) [virtual]

Write a object instance to data output stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

#### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1613).

6.870.3.7 virtual void activemq::wireformat::openwire::marshal::v4::WireFormatInfoMarshaller::tightUnmarshal  
( OpenWireFormat \* *wireFormat*, commands::DataStructure \*  
*dataStructure*, decaf::io::DataInputStream \* *dataIn*, utils::BooleanStream \*  
*bs* ) throw ( decaf::io::IOException ) [virtual]

Un-marshal an object instance from the data input stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

#### Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1620).

### 6.871.1 Detailed Description

Marshaling code for Open Wire Format for **WireFormatInfoMarshaller** (p. 3939).

NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

## 6.871.2 Constructor & Destructor Documentation

6.871.2.1 `activemq::wireformat::openwire::marshal::v1::WireFormatInfoMarshaller::WireFormatInfoMarshaller ( ) [inline]`

6.871.2.2 `virtual activemq::wireformat::openwire::marshal::v1::WireFormatInfoMarshaller::~~WireFormatInfoMarshaller ( ) [inline, virtual]`

## 6.871.3 Member Function Documentation

6.871.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::WireFormatInfoMarshaller::createObject ( ) const [virtual]`

Creates a new instance of this marshalable type.

### Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1578).

6.871.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v1::WireFormatInfoMarshaller::getDataStructureType ( ) const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

### Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1585).

6.871.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::WireFormatInfoMarshaller::looseMarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut ) throw ( decaf::io::IOException ) [virtual]`

Write a object instance to data output stream.

### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1591).

```
6.871.3.4  virtual void activemq::wireformat::openwire::marshal::v1::WireFormatInfoMarshaller::looseUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure,
  decaf::io::DataInputStream * dataIn ) throw ( decaf::io::IOException )
[virtual]
```

Un-marshal an object instance from the data input stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

**Exceptions**

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1599).

```
6.871.3.5  virtual int activemq::wireformat::openwire::marshal::v1::WireFormatInfoMarshaller::tightMarshal1
( OpenWireFormat * wireFormat, commands::DataStructure *
  dataStructure, utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write the booleans that this object uses to a BooleanStream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

**Returns**

int value indicating the size of the marshaled object.

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1606).

## 6.871 activemq::wireformat::openwire::marshal::v1::WireFormatInfoMarshaller

### Class Reference 3955

6.871.3.6 virtual void activemq::wireformat::openwire::marshal::v1::WireFormatInfoMarshaller::tightMarshal2  
( OpenWireFormat \* *wireFormat*, commands::DataStructure \* *dataStructure*,  
decaf::io::DataOutputStream \* *dataOut*, utils::BooleanStream \* *bs* ) throw  
( decaf::io::IOException ) [virtual]

Write a object instance to data output stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

#### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1613).

6.871.3.7 virtual void activemq::wireformat::openwire::marshal::v1::WireFormatInfoMarshaller::tightUnmarshal  
( OpenWireFormat \* *wireFormat*, commands::DataStructure \*  
*dataStructure*, decaf::io::DataInputStream \* *dataIn*, utils::BooleanStream \*  
*bs* ) throw ( decaf::io::IOException ) [virtual]

Un-marshal an object instance from the data input stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

#### Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1620).

The documentation for this class was generated from the following file:

### 6.872.1 Detailed Description

Marshaling code for Open Wire Format for **WireFormatInfoMarshaller** (p. 3943).

NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

## 6.872.2 Constructor & Destructor Documentation

6.872.2.1 `activemq::wireformat::openwire::marshal::v3::WireFormatInfoMarshaller::WireFormatInfoMarshaller ( ) [inline]`

6.872.2.2 `virtual activemq::wireformat::openwire::marshal::v3::WireFormatInfoMarshaller::~~WireFormatInfoMarshaller ( ) [inline, virtual]`

## 6.872.3 Member Function Documentation

6.872.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::WireFormatInfoMarshaller::createObject ( ) const [virtual]`

Creates a new instance of this marshalable type.

### Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1578).

6.872.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v3::WireFormatInfoMarshaller::getDataStructureType ( ) const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

### Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1585).

6.872.3.3 `virtual void activemq::wireformat::openwire::marshal::v3::WireFormatInfoMarshaller::looseMarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut ) throw ( decaf::io::IOException ) [virtual]`

Write a object instance to data output stream.

### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1591).

```
6.872.3.4  virtual void activemq::wireformat::openwire::marshal::v3::WireFormatInfoMarshaller::looseUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure,
  decaf::io::DataInputStream * dataIn ) throw ( decaf::io::IOException )
[virtual]
```

Un-marshal an object instance from the data input stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

**Exceptions**

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1599).

```
6.872.3.5  virtual int activemq::wireformat::openwire::marshal::v3::WireFormatInfoMarshaller::tightMarshal1
( OpenWireFormat * wireFormat, commands::DataStructure *
  dataStructure, utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write the booleans that this object uses to a BooleanStream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

**Returns**

int value indicating the size of the marshaled object.

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1606).

6.872.3.6 virtual void activemq::wireformat::openwire::marshal::v3::WireFormatInfoMarshaller::tightMarshal2 ( OpenWireFormat \* *wireFormat*, commands::DataStructure \* *dataStructure*, decaf::io::DataOutputStream \* *dataOut*, utils::BooleanStream \* *bs* ) throw ( decaf::io::IOException ) [virtual]

Write a object instance to data output stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

#### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1613).

6.872.3.7 virtual void activemq::wireformat::openwire::marshal::v3::WireFormatInfoMarshaller::tightUnmarshal ( OpenWireFormat \* *wireFormat*, commands::DataStructure \* *dataStructure*, decaf::io::DataInputStream \* *dataIn*, utils::BooleanStream \* *bs* ) throw ( decaf::io::IOException ) [virtual]

Un-marshal an object instance from the data input stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

#### Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1620).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v3/**WireFormatInfoMarshaller.h**

## 6.873 activemq::wireformat::WireFormatNegotiator Class Reference

Defines a **WireFormatNegotiator** (p. 3946) which allows a **WireFormat** (p. 3907) to.

```
#include <src/main/activemq/wireformat/WireFormatNegotiator.h>
```

Inheritance diagram for `activemq::wireformat::WireFormatNegotiator`:

## Public Member Functions

- **WireFormatNegotiator** (const **Pointer**< **transport::Transport** > &next)  
*Constructor.*
- virtual ~**WireFormatNegotiator** ()

### 6.873.1 Detailed Description

Defines a **WireFormatNegotiator** (p. 3946) which allows a **WireFormat** (p. 3907) to.

### 6.873.2 Constructor & Destructor Documentation

6.873.2.1 `activemq::wireformat::WireFormatNegotiator::WireFormatNegotiator ( const Pointer< transport::Transport > &next ) [inline]`

Constructor.

#### Parameters

<i>next</i>	- the next Transport in the chain
-------------	-----------------------------------

6.873.2.2 `virtual activemq::wireformat::WireFormatNegotiator::~~WireFormatNegotiator ( ) [inline, virtual]`

The documentation for this class was generated from the following file:

- `src/main/activemq/wireformat/WireFormatNegotiator.h`

## 6.874 activemq::wireformat::WireFormatRegistry Class Reference

Registry of all **WireFormat** (p. 3907) Factories that are available to the client at runtime.

```
#include <src/main/activemq/wireformat/WireFormatRegistry.h>
```

## Public Member Functions

- virtual ~**WireFormatRegistry** ()

- **WireFormatFactory** \* **findFactory** (const std::string &name) const throw ( decaf::lang::exceptions::NoSuchElementException )  
*Gets a Registered **WireFormatFactory** (p. 3911) from the Registry and returns it if there is not a registered format factory with the given name an exception is thrown.*
- void **registerFactory** (const std::string &name, **WireFormatFactory** \*factory) throw ( decaf::lang::exceptions::IllegalArgumentException, decaf::lang::exceptions::NullPointerException )  
*Registers a new **WireFormatFactory** (p. 3911) with this Registry.*
- void **unregisterFactory** (const std::string &name)  
*Unregisters the Factory with the given name and deletes that instance of the Factory.*
- std::vector< std::string > **getWireFormatNames** () const  
*Retrieves a list of the names of all the Registered WireFormat's in this Registry.*

### Static Public Member Functions

- static **WireFormatRegistry** & **getInstance** ()  
*Gets the single instance of the **WireFormatRegistry** (p. 3947).*

### 6.874.1 Detailed Description

Registry of all **WireFormat** (p. 3907) Factories that are available to the client at runtime.

New WireFormat's must have a factory registered here before a connection attempt is made.

#### Since

3.0

### 6.874.2 Constructor & Destructor Documentation

6.874.2.1 virtual activemq::wireformat::WireFormatRegistry::~WireFormatRegistry ( )  
 [virtual]

### 6.874.3 Member Function Documentation

6.874.3.1 **WireFormatFactory**\* activemq::wireformat::WireFormatRegistry::findFactory  
 ( const std::string & name ) const throw ( decaf::lang::exceptions::NoSuchElementException )

Gets a Registered **WireFormatFactory** (p. 3911) from the Registry and returns it if there is not a registered format factory with the given name an exception is thrown.

#### Parameters

<i>name</i>	The name of the Factory to find in the Registry.
-------------	--

**Returns**

the Factory registered under the given name.

**Exceptions**

<i>NoSuchElementException</i>	if no factory is registered with that name.
-------------------------------	---

```
6.874.3.2 static WireFormatRegistry& activemq::wireformat::WireFormatRegistry::getInstance ( )  
[static]
```

Gets the single instance of the **WireFormatRegistry** (p. 3947).

**Returns**

reference to the single instance of this Registry

```
6.874.3.3 std::vector<std::string> activemq::wireformat::WireFormatRegistry::getWireFormatNames  
( ) const
```

Retrieves a list of the names of all the Registered WireFormat's in this Registry.

**Returns**

stl vector of strings with all the **WireFormat** (p. 3907) names registered.

```
6.874.3.4 void activemq::wireformat::WireFormatRegistry::registerFactory  
( const std::string & name, WireFormatFactory * factory )  
throw ( decaf::lang::exceptions::IllegalArgumentException,  
decaf::lang::exceptions::NullPointerException )
```

Registers a new **WireFormatFactory** (p. 3911) with this Registry.

If a Factory with the given name is already registered it is overwritten with the new one. Once a factory is added to the Registry its lifetime is controlled by the Registry, it will be deleted once the Registry has been deleted.

**Parameters**

<i>name</i>	The name of the new Factory to register.
<i>factory</i>	The new Factory to add to the Registry.

**Exceptions**

<i>IllegalArgumentException</i>	is name is the empty string.
---------------------------------	------------------------------

<i>NullPointerException</i>	if the Factory is Null.
-----------------------------	-------------------------

6.874.3.5 void activemq::wireformat::WireFormatRegistry::unregisterFactory ( const std::string & name )

Unregisters the Factory with the given name and deletes that instance of the Factory.

#### Parameters

<i>name</i>	Name of the Factory to unregister and destroy
-------------	---

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/**WireFormatRegistry.h**

## 6.875 activemq::transport::inactivity::WriteChecker Class Reference

Runnable class used by the {.

```
#include <src/main/activemq/transport/inactivity/WriteChecker.h>
```

Inheritance diagram for activemq::transport::inactivity::WriteChecker:

### Public Member Functions

- **WriteChecker** (**InactivityMonitor** \*parent)
- virtual ~**WriteChecker** ()
- virtual void **run** ()

*Run method - called by the Thread class in the context of the thread.*

### 6.875.1 Detailed Description

Runnable class used by the {.

#### See also

**InactivityMonitor** (p. 1964)} to make periodic writes to the underlying **transport** (p. 99) if no other write activity is going on in order to more quickly detect failures of the connection to the broker.

#### Since

3.1.0

## 6.875.2 Constructor & Destructor Documentation

6.875.2.1 `activemq::transport::inactivity::WriteChecker::WriteChecker ( InactivityMonitor * parent )`

6.875.2.2 `virtual activemq::transport::inactivity::WriteChecker::~~WriteChecker ( )`  
[virtual]

## 6.875.3 Member Function Documentation

6.875.3.1 `virtual void activemq::transport::inactivity::WriteChecker::run ( )` [virtual]

Run method - called by the Thread class in the context of the thread.

Implements **decaf::lang::Runnable** (p. 3265).

The documentation for this class was generated from the following file:

- `src/main/activemq/transport/inactivity/WriteChecker.h`

## 6.876 decaf::io::Writer Class Reference

```
#include <src/main/decaf/io/Writer.h>
```

Inheritance diagram for `decaf::io::Writer`:

### Public Member Functions

- **Writer** ()
- virtual **~Writer** ()
- virtual void **write** (char v) throw ( decaf::io::IOException )  
*Writes an single byte char value.*

*Appends the specified character sequence to this Appendable.*
- virtual **decaf::lang::Appendable & append** (const **decaf::lang::CharSequence** \*csq, int start, int end) throw ( decaf::io::IOException, decaf::lang::exceptions::IndexOutOfBoundsException )  
*Appends a subsequence of the specified character sequence to this Appendable.*

## Protected Member Functions

- virtual void **doWriteArrayBounded** (const char \*buffer, int size, int offset, int length)=0 throw ( decaf::io::IOException, decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException )  
*Override this method to customize the functionality of the method write( char\* buffer, int size, int offset, int length ).*
- virtual void **doWriteChar** (char v) throw ( decaf::io::IOException )
- virtual void **doWriteVector** (const std::vector< char > &buffer) throw ( decaf::io::IOException )
- virtual void **doWriteArray** (const char \*buffer, int size) throw ( decaf::io::IOException, decaf::lang::exceptions::NullPointerException )
- virtual void **doWriteString** (const std::string &str) throw ( decaf::io::IOException )
- virtual void **doWriteStringBounded** (const std::string &str, int offset, int length) throw ( decaf::io::IOException, decaf::lang::exceptions::IndexOutOfBoundsException )
- virtual **decaf::lang::Appendable & doAppendChar** (char value) throw ( decaf::io::IOException )
- virtual **decaf::lang::Appendable & doAppendCharSequence** (const **decaf::lang::CharSequence** \*csq) throw ( decaf::io::IOException )
- virtual **decaf::lang::Appendable & doAppendCharSequenceStartEnd** (const **decaf::lang::CharSequence** \*csq, int start, int end) throw ( decaf::io::IOException, decaf::lang::exceptions::IndexOutOfBoundsException )

## 6.876.1 Constructor & Destructor Documentation

6.876.1.1 decaf::io::Writer::Writer ( )

6.876.1.2 virtual decaf::io::Writer::~Writer ( ) [virtual]

## 6.876.2 Member Function Documentation

6.876.2.1 `virtual decaf::lang::Appendable& decaf::io::Writer::append ( char value ) throw ( decaf::io::IOException )` [virtual]

Appends the specified character to this Appendable.

#### Parameters

<i>value</i>	The character to append.
--------------	--------------------------

#### Returns

a Reference to this Appendable

#### Exceptions

<i>Exception</i>	if an error occurs.
------------------	---------------------

Implements **decaf::lang::Appendable** (p. 694).

6.876.2.2 `virtual decaf::lang::Appendable& decaf::io::Writer::append ( const decaf::lang::CharSequence * csq ) throw ( decaf::io::IOException )` [virtual]

Appends the specified character sequence to this Appendable.

#### Parameters

<i>csq</i>	The character sequence from which a subsequence will be appended. If <i>csq</i> is NULL, then characters will be appended as if <i>csq</i> contained the string "null".
------------	---

#### Returns

a Reference to this Appendable.

#### Exceptions

<i>Exception</i>	if an error occurs.
------------------	---------------------

Implements **decaf::lang::Appendable** (p. 695).

6.876.2.3 `virtual decaf::lang::Appendable& decaf::io::Writer::append ( const decaf::lang::CharSequence * csq, int start, int end ) throw ( decaf::io::IOException, decaf::lang::exceptions::IndexOutOfBoundsException )` [virtual]

Appends a subsequence of the specified character sequence to this Appendable.

#### Parameters

<i>csq</i>	- The character sequence from which a subsequence will be appended. If <i>csq</i> is NULL, then characters will be appended as if <i>csq</i> contained the string "null".
<i>start</i>	The index of the first character in the subsequence.
<i>end</i>	The index of the character following the last character in the subsequence.

**Returns**

a Reference to this Appendable

**Exceptions**

<i>Exception</i>	if an error occurs.
<i>IndexOutOfBoundsException</i>	<i>start</i> is greater than <i>end</i> , or <i>end</i> is greater than <i>csq.length()</i>

Implements **decaf::lang::Appendable** (p. 695).

6.876.2.4 virtual **decaf::lang::Appendable&** **decaf::io::Writer::doAppendChar** ( *char value* )  
throw ( **decaf::io::IOException** ) [protected, virtual]

6.876.2.5 virtual **decaf::lang::Appendable&** **decaf::io::Writer::doAppendCharSequence** ( **const decaf::lang::CharSequence \* csq** ) throw ( **decaf::io::IOException** )  
[protected, virtual]

6.876.2.6 virtual **decaf::lang::Appendable&** **decaf::io::Writer::doAppendCharSequenceStartEnd** ( **const decaf::lang::CharSequence \* csq**, *int start*, *int end* ) throw ( **decaf::io::IOException**, **decaf::lang::exceptions::IndexOutOfBoundsException** ) [protected, virtual]

6.876.2.7 virtual void **decaf::io::Writer::doWriteArray** ( **const char \* buffer**, *int size* ) throw ( **decaf::io::IOException**, **decaf::lang::exceptions::NullPointerException** )  
[protected, virtual]

6.876.2.8 virtual void **decaf::io::Writer::doWriteArrayBounded** ( **const char \* buffer**, *int size*, *int offset*, *int length* ) throw ( **decaf::io::IOException**, **decaf::lang::exceptions::NullPointerException**, **decaf::lang::exceptions::IndexOutOfBoundsException** )  
[protected, pure virtual]

Override this method to customize the functionality of the method **write**( *char\* buffer*, *int size*, *int offset*, *int length* ).

All subclasses must override this method to provide the basic **Writer** (p. 3951) functionality.

Implemented in **decaf::io::OutputStreamWriter** (p. 2866).

- 6.876.2.9 `virtual void decaf::io::Writer::doWriteChar ( char v ) throw ( decaf::io::IOException )` [protected, virtual]
- 6.876.2.10 `virtual void decaf::io::Writer::doWriteString ( const std::string & str ) throw ( decaf::io::IOException )` [protected, virtual]
- 6.876.2.11 `virtual void decaf::io::Writer::doWriteStringBounded ( const std::string & str, int offset, int length ) throw ( decaf::io::IOException, decaf::lang::exceptions::IndexOutOfBoundsException )` [protected, virtual]
- 6.876.2.12 `virtual void decaf::io::Writer::doWriteVector ( const std::vector< char > & buffer ) throw ( decaf::io::IOException )` [protected, virtual]
- 6.876.2.13 `virtual void decaf::io::Writer::write ( char v ) throw ( decaf::io::IOException )` [virtual]

Writes an single byte char value.

#### Parameters

<i>v</i>	The value to be written.
----------	--------------------------

#### Exceptions

<b><i>IOException</i></b> (p. 2103)	thrown if an error occurs.
--	----------------------------

- 6.876.2.14 `virtual void decaf::io::Writer::write ( const std::string & str ) throw ( decaf::io::IOException )` [virtual]

Writes a string.

#### Parameters

<i>str</i>	The string to be written.
------------	---------------------------

#### Exceptions

<b><i>IOException</i></b> (p. 2103)	thrown if an error occurs.
--	----------------------------

- 6.876.2.15 `virtual void decaf::io::Writer::write ( const std::string & str, int offset, int length ) throw ( decaf::io::IOException, decaf::lang::exceptions::IndexOutOfBoundsException )` [virtual]

Writes a string.

**Parameters**

<i>str</i>	The string to be written.
<i>offset</i>	The position in the array to start writing from.
<i>length</i>	The number of bytes in the array to write.

**Exceptions**

<b><i>IOException</i></b> (p. 2103)	thrown if an error occurs.
<i>IndexOutOfBoundsException</i>	if offset+length is greater than the string length.

6.876.2.16 `virtual void decaf::io::Writer::write ( const char * buffer, int size ) throw ( decaf::io::IOException, decaf::lang::exceptions::NullPointerException ) [virtual]`

Writes a byte array to the output stream.

**Parameters**

<i>buffer</i>	The byte array to write (cannot be NULL).
<i>size</i>	The size in bytes of the buffer passed.

**Exceptions**

<b><i>IOException</i></b> (p. 2103)	if an I/O error occurs.
<i>NullPointerException</i>	if <i>buffer</i> is NULL.

6.876.2.17 `virtual void decaf::io::Writer::write ( const std::vector< char > & buffer ) throw ( decaf::io::IOException ) [virtual]`

Writes an array of Chars.

**Parameters**

<i>buffer</i>	The array to be written.
---------------	--------------------------

**Exceptions**

<b><i>IOException</i></b> (p. 2103)	thrown if an error occurs.
--	----------------------------

6.876.2.18 `virtual void decaf::io::Writer::write ( const char * buffer, int size, int offset, int length ) throw ( decaf::io::IOException, decaf::lang::exceptions::NullPointerException, decaf::lang::exceptions::IndexOutOfBoundsException )` [virtual]

Writes a byte array to the output stream.

#### Parameters

<i>buffer</i>	The byte array to write (cannot be NULL).
<i>size</i>	The size in bytes of the buffer passed.
<i>offset</i>	The position in the array to start writing from.
<i>length</i>	The number of bytes in the array to write.

#### Exceptions

<b>IOException</b> (p. 2103)	if an I/O error occurs.
<i>NullPointerException</i>	if buffer is NULL.
<i>IndexOutOfBoundsException</i>	if offset + length > size of the buffer.

The documentation for this class was generated from the following file:

### Protected Attributes

- int **formatId**
- std::vector< unsigned char > **globalTransactionId**
- std::vector< unsigned char > **branchQualifier**

## 6.879.1 Member Typedef Documentation

- 6.879.1.1 **typedef decaf::lang::PointerComparator<XATransactionId>  
activemq::commands::XATransactionId::COMPARATOR**

Reimplemented from **activemq::commands::TransactionId** (p. 3760).

## 6.879.2 Constructor & Destructor Documentation

6.879.2.1 `activemq::commands::XATransactionId::XATransactionId ( )`

6.879.2.2 `activemq::commands::XATransactionId::XATransactionId ( const XATransactionId & other )`

6.879.2.3 `virtual activemq::commands::XATransactionId::~~XATransactionId ( )`  
[virtual]

## 6.879.3 Member Function Documentation

6.879.3.1 `virtual XATransactionId* activemq::commands::XATransactionId::cloneDataStructure ( ) const` [virtual]

Clone this object and return a new instance that the caller now owns, this will be an exact copy of this one.

### Returns

new copy of this object.

Reimplemented from `activemq::commands::TransactionId` (p. 3761).

6.879.3.2 `virtual int activemq::commands::XATransactionId::compareTo ( const XATransactionId & value ) const` [virtual]

6.879.3.3 `virtual void activemq::commands::XATransactionId::copyDataStructure ( const DataStructure * src )` [virtual]

Copy the contents of the passed object into this object's members, overwriting any existing data.

### Parameters

<code>src</code>	- Source Object
------------------	-----------------

Reimplemented from `activemq::commands::TransactionId` (p. 3761).

6.879.3.4 `virtual bool activemq::commands::XATransactionId::equals ( const DataStructure * value ) const` [virtual]

Compares the `DataStructure` (p. 1628) passed in to this one, and returns if they are equivalent.

Equivalent here means that they are of the same type, and that each element of the objects are the same.

**Returns**

true if DataStructure's are Equal.

Reimplemented from **activemq::commands::TransactionId** (p. 3761).

- 6.879.3.5 `virtual bool activemq::commands::XATransactionId::equals ( const XATransactionId & value ) const [virtual]`
- 6.879.3.6 `virtual const std::vector<unsigned char>& activemq::commands::XATransactionId::getBranchQualifier ( ) const [virtual]`
- 6.879.3.7 `virtual std::vector<unsigned char>& activemq::commands::XATransactionId::getBranchQualifier ( ) [virtual]`
- 6.879.3.8 `virtual unsigned char activemq::commands::XATransactionId::getDataStructureType ( ) const [virtual]`

Get the unique identifier that this object and its own Marshaler share.

**Returns**

new **DataStructure** (p. 1628) type copy.

Reimplemented from **activemq::commands::TransactionId** (p. 3762).

- 6.879.3.9 `virtual int activemq::commands::XATransactionId::getFormatId ( ) const [virtual]`
- 6.879.3.10 `virtual const std::vector<unsigned char>& activemq::commands::XATransactionId::getGlobalTransactionId ( ) const [virtual]`
- 6.879.3.11 `virtual std::vector<unsigned char>& activemq::commands::XATransactionId::getGlobalTransactionId ( ) [virtual]`
- 6.879.3.12 `virtual bool activemq::commands::XATransactionId::operator< ( const XATransactionId & value ) const [virtual]`
- 6.879.3.13 `XATransactionId& activemq::commands::XATransactionId::operator= ( const XATransactionId & other )`
- 6.879.3.14 `virtual bool activemq::commands::XATransactionId::operator== ( const XATransactionId & value ) const [virtual]`

## 6.880 activemq::wireformat::openwire::marshal::v6::XATransactionIdMarshaller

---

### Class Reference 3977

- 6.879.3.15 `virtual void activemq::commands::XATransactionId::setBranchQualifier ( const std::vector< unsigned char > & branchQualifier ) [virtual]`
- 6.879.3.16 `virtual void activemq::commands::XATransactionId::setFormatId ( int formatId ) [virtual]`
- 6.879.3.17 `virtual void activemq::commands::XATransactionId::setGlobalTransactionId ( const std::vector< unsigned char > & globalTransactionId ) [virtual]`
- 6.879.3.18 `virtual std::string activemq::commands::XATransactionId::toString ( ) const [virtual]`

Returns a string containing the information for this **DataSet** (p. 1628) such as its type and value of its elements.

#### Returns

formatted string useful for debugging.

Reimplemented from **activemq::commands::TransactionId** (p. 3762).

#### 6.879.4 Field Documentation

- 6.879.4.1 `std::vector<unsigned char> activemq::commands::XATransactionId::branchQualifier [protected]`
- 6.879.4.2 `int activemq::commands::XATransactionId::formatId [protected]`
- 6.879.4.3 `std::vector<unsigned char> activemq::commands::XATransactionId::globalTransactionId [protected]`
- 6.879.4.4 `const unsigned char activemq::commands::XATransactionId::ID_ - XATRANSACTIONID = 112 [static]`

The documentation for this class was generated from the following file:

- `src/main/activemq/commands/XATransactionId.h`

## 6.880 activemq::wireformat::openwire::marshal::v6::XATransactionIdMarshaller

### 6.880.1 Detailed Description

Marshaling code for Open Wire Format for **XATransactionIdMarshaller** (p. 3964).

NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the `activemq-openwire-generator` module

### 6.880.2 Constructor & Destructor Documentation

- 6.880.2.1 `activemq::wireformat::openwire::marshal::v6::XATransactionIdMarshaller::XATransactionIdMarshaller`  
( ) [inline]

## 6.880 activemq::wireformat::openwire::marshal::v6::XATransactionIdMarshaller

### Class Reference 3979

6.880.2.2 virtual activemq::wireformat::openwire::marshal::v6::XATransactionIdMarshaller::~XATransactionIdMarshaller ( ) [inline, virtual]

### 6.880.3 Member Function Documentation

6.880.3.1 virtual commands::DataStructure\* activemq::wireformat::openwire::marshal::v6::XATransactionIdMarshaller::createObject ( ) const [virtual]

Creates a new instance of this marshalable type.

#### Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1578).

6.880.3.2 virtual unsigned char activemq::wireformat::openwire::marshal::v6::XATransactionIdMarshaller::getDataStructureType ( ) const [virtual]

Get the Data Structure Type that identifies this Marshaler.

#### Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1585).

6.880.3.3 virtual void activemq::wireformat::openwire::marshal::v6::XATransactionIdMarshaller::looseMarshal ( OpenWireFormat \* wireFormat, commands::DataStructure \* dataStructure, decaf::io::DataOutputStream \* dataOut ) throw ( decaf::io::IOException ) [virtual]

Write a object instance to data output stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

#### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v6::TransactionIdMarshaller** (p. 3782).

```

6.880.3.4  virtual void activemq::wireformat::openwire::marshal::v6::XATransactionIdMarshaller::looseUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure,
  decaf::io::DataInputStream * dataIn ) throw ( decaf::io::IOException )
[virtual]

```

Un-marshall an object instance from the data input stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

#### Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v6::TransactionIdMarshaller** (p. 3783).

```

6.880.3.5  virtual int activemq::wireformat::openwire::marshal::v6::XATransactionIdMarshaller::tightMarshal1
( OpenWireFormat * wireFormat, commands::DataStructure *
  dataStructure, utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]

```

Write the booleans that this object uses to a BooleanStream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

#### Returns

int value indicating the size of the marshaled object.

#### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v6::TransactionIdMarshaller** (p. 3783).

## 6.880 activemq::wireformat::openwire::marshal::v6::XATransactionIdMarshaller

### Class Reference 3981

6.880.3.6 virtual void activemq::wireformat::openwire::marshal::v6::XATransactionIdMarshaller::tightMarshal2  
( OpenWireFormat \* *wireFormat*, commands::DataStructure \* *dataStructure*,  
decaf::io::DataOutputStream \* *dataOut*, utils::BooleanStream \* *bs* ) throw  
( decaf::io::IOException ) [virtual]

Write a object instance to data output stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

#### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v6::TransactionIdMarshaller**  
(p. 3784).

6.880.3.7 virtual void activemq::wireformat::openwire::marshal::v6::XATransactionIdMarshaller::tightUnmarshal  
( OpenWireFormat \* *wireFormat*, commands::DataStructure \*  
*dataStructure*, decaf::io::DataInputStream \* *dataIn*, utils::BooleanStream \*  
*bs* ) throw ( decaf::io::IOException ) [virtual]

Un-marshall an object instance from the data input stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

#### Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v6::TransactionIdMarshaller**  
(p. 3784).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v6/XATransactionIdMarshaller.h

## 6.881 activemq::wireformat::openwire::marshal::v2::XATransactionIdMarshaller

### Class Reference

Marshaling code for Open Wire Format for **XATransactionIdMarshaller** (p. 3968).

```
#include <src/main/activemq/wireformat/openwire/marshal/v2/XATransactionId
```

### 6.881.1 Detailed Description

Marshaling code for Open Wire Format for **XATransactionIdMarshaller** (p. 3968).

NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

## 6.881.2 Constructor & Destructor Documentation

6.881.2.1 `activemq::wireformat::openwire::marshal::v2::XATransactionIdMarshaller::XATransactionIdMarshaller ( ) [inline]`

6.881.2.2 `virtual activemq::wireformat::openwire::marshal::v2::XATransactionIdMarshaller::~~XATransactionIdMarshaller ( ) [inline, virtual]`

## 6.881.3 Member Function Documentation

6.881.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v2::XATransactionIdMarshaller::createObject ( ) const [virtual]`

Creates a new instance of this marshalable type.

### Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1578).

6.881.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v2::XATransactionIdMarshaller::getDataStructureType ( ) const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

### Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1585).

6.881.3.3 `virtual void activemq::wireformat::openwire::marshal::v2::XATransactionIdMarshaller::looseMarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut ) throw ( decaf::io::IOException ) [virtual]`

Write a object instance to data output stream.

### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v2::TransactionIdMarshaller** (p. 3771).

```
6.881.3.4  virtual void activemq::wireformat::openwire::marshal::v2::XATransactionIdMarshaller::looseUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure,
  decaf::io::DataInputStream * dataIn ) throw ( decaf::io::IOException )
[virtual]
```

Un-marshal an object instance from the data input stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

**Exceptions**

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v2::TransactionIdMarshaller** (p. 3772).

```
6.881.3.5  virtual int activemq::wireformat::openwire::marshal::v2::XATransactionIdMarshaller::tightMarshal1
( OpenWireFormat * wireFormat, commands::DataStructure *
  dataStructure, utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write the booleans that this object uses to a BooleanStream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

**Returns**

int value indicating the size of the marshaled object.

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

## 6.881 activemq::wireformat::openwire::marshal::v2::XATransactionIdMarshaller

---

Class Reference3985

Reimplemented from **activemq::wireformat::openwire::marshal::v2::TransactionIdMarshaller** (p. 3772).

6.881.3.6 `virtual void activemq::wireformat::openwire::marshal::v2::XATransactionIdMarshaller::tightMarshal2 ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]`

Write a object instance to data output stream.

### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v2::TransactionIdMarshaller** (p. 3773).

6.881.3.7 `virtual void activemq::wireformat::openwire::marshal::v2::XATransactionIdMarshaller::tightUnmarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]`

Un-marshall an object instance from the data input stream.

### Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

### Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v2::TransactionIdMarshaller** (p. 3773).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v2/**XATransactionIdMarshaller.h**

## 6.882 activemq::wireformat::openwire::marshal::v4::XATransactionIdMarshaller

6.882.2.1 `activemq::wireformat::openwire::marshal::v4::XATransactionIdMarshaller::XATransactionIdMarshaller ( ) [inline]`

6.882.2.2 `virtual activemq::wireformat::openwire::marshal::v4::XATransactionIdMarshaller::~~XATransactionIdMarshaller ( ) [inline, virtual]`

## 6.882.3 Member Function Documentation

6.882.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v4::XATransactionIdMarshaller::createObject ( ) const [virtual]`

Creates a new instance of this marshalable type.

### Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1578).

6.882.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v4::XATransactionIdMarshaller::getDataStructureType ( ) const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

### Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1585).

6.882.3.3 `virtual void activemq::wireformat::openwire::marshal::v4::XATransactionIdMarshaller::looseMarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut ) throw ( decaf::io::IOException ) [virtual]`

Write a object instance to data output stream.

### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v4::TransactionIdMarshaller** (p. 3779).

```
6.882.3.4  virtual void activemq::wireformat::openwire::marshal::v4::XATransactionIdMarshaller::looseUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure,
  decaf::io::DataInputStream * dataIn ) throw ( decaf::io::IOException )
[virtual]
```

Un-marshal an object instance from the data input stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

**Exceptions**

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v4::TransactionIdMarshaller** (p. 3779).

```
6.882.3.5  virtual int activemq::wireformat::openwire::marshal::v4::XATransactionIdMarshaller::tightMarshal1
( OpenWireFormat * wireFormat, commands::DataStructure *
  dataStructure, utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write the booleans that this object uses to a BooleanStream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

**Returns**

int value indicating the size of the marshaled object.

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

## 6.882 activemq::wireformat::openwire::marshal::v4::XATransactionIdMarshaller

### Class Reference 3989

Reimplemented from **activemq::wireformat::openwire::marshal::v4::TransactionIdMarshaller** (p. 3780).

```
6.882.3.6 virtual void activemq::wireformat::openwire::marshal::v4::XATransactionIdMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure,
  decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs ) throw
( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

#### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v4::TransactionIdMarshaller** (p. 3780).

```
6.882.3.7 virtual void activemq::wireformat::openwire::marshal::v4::XATransactionIdMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
  dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream *
  bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

#### Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v4::TransactionIdMarshaller** (p. 3781).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v4/**XATransactionIdMarshaller.h**

## 6.883 activemq::wireformat::openwire::marshal::v1::XATransactionIdMarshaller

### Class Reference

### 6.883.1 Detailed Description

Marshaling code for Open Wire Format for **XATransactionIdMarshaller** (p. 3976).

NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

## 6.883.2 Constructor & Destructor Documentation

6.883.2.1 `activemq::wireformat::openwire::marshal::v1::XATransactionIdMarshaller::XATransactionIdMarshaller ( ) [inline]`

6.883.2.2 `virtual activemq::wireformat::openwire::marshal::v1::XATransactionIdMarshaller::~~XATransactionIdMarshaller ( ) [inline, virtual]`

## 6.883.3 Member Function Documentation

6.883.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v1::XATransactionIdMarshaller::createObject ( ) const [virtual]`

Creates a new instance of this marshalable type.

### Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1578).

6.883.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v1::XATransactionIdMarshaller::getDataStructureType ( ) const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

### Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1585).

6.883.3.3 `virtual void activemq::wireformat::openwire::marshal::v1::XATransactionIdMarshaller::looseMarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut ) throw ( decaf::io::IOException ) [virtual]`

Write a object instance to data output stream.

### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v1::TransactionIdMarshaller** (p. 3767).

```
6.883.3.4  virtual void activemq::wireformat::openwire::marshal::v1::XATransactionIdMarshaller::looseUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure,
  decaf::io::DataInputStream * dataIn ) throw ( decaf::io::IOException )
[virtual]
```

Un-marshal an object instance from the data input stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

**Exceptions**

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v1::TransactionIdMarshaller** (p. 3768).

```
6.883.3.5  virtual int activemq::wireformat::openwire::marshal::v1::XATransactionIdMarshaller::tightMarshal1
( OpenWireFormat * wireFormat, commands::DataStructure *
  dataStructure, utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write the booleans that this object uses to a BooleanStream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

**Returns**

int value indicating the size of the marshaled object.

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

## 6.883 activemq::wireformat::openwire::marshal::v1::XATransactionIdMarshaller

### Class Reference 3993

Reimplemented from **activemq::wireformat::openwire::marshal::v1::TransactionIdMarshaller** (p. 3768).

```
6.883.3.6 virtual void activemq::wireformat::openwire::marshal::v1::XATransactionIdMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure,
  decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs ) throw
( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

#### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v1::TransactionIdMarshaller** (p. 3769).

```
6.883.3.7 virtual void activemq::wireformat::openwire::marshal::v1::XATransactionIdMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
  dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream *
  bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

#### Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v1::TransactionIdMarshaller** (p. 3769).

The documentation for this class was generated from the following file:

6.884.2.2 `virtual activemq::wireformat::openwire::marshal::v3::XATransactionIdMarshaller::~~XATransactionIdMarshaller ( ) [inline, virtual]`

## 6.884.3 Member Function Documentation

6.884.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v3::XATransactionIdMarshaller::createObject ( ) const [virtual]`

Creates a new instance of this marshalable type.

### Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1578).

6.884.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v3::XATransactionIdMarshaller::getDataStructureType ( ) const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

### Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1585).

6.884.3.3 `virtual void activemq::wireformat::openwire::marshal::v3::XATransactionIdMarshaller::looseMarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut ) throw ( decaf::io::IOException ) [virtual]`

Write a object instance to data output stream.

### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v3::TransactionIdMarshaller** (p. 3775).

```
6.884.3.4  virtual void activemq::wireformat::openwire::marshal::v3::XATransactionIdMarshaller::looseUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure,
  decaf::io::DataInputStream * dataIn ) throw ( decaf::io::IOException )
[virtual]
```

Un-marshal an object instance from the data input stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

**Exceptions**

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v3::TransactionIdMarshaller** (p. 3775).

```
6.884.3.5  virtual int activemq::wireformat::openwire::marshal::v3::XATransactionIdMarshaller::tightMarshal1
( OpenWireFormat * wireFormat, commands::DataStructure *
  dataStructure, utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write the booleans that this object uses to a BooleanStream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

**Returns**

int value indicating the size of the marshaled object.

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

## 6.884 activemq::wireformat::openwire::marshal::v3::XATransactionIdMarshaller

### Class Reference 3997

Reimplemented from **activemq::wireformat::openwire::marshal::v3::TransactionIdMarshaller** (p. 3776).

6.884.3.6 `virtual void activemq::wireformat::openwire::marshal::v3::XATransactionIdMarshaller::tightMarshal2 ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]`

Write a object instance to data output stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

#### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v3::TransactionIdMarshaller** (p. 3776).

6.884.3.7 `virtual void activemq::wireformat::openwire::marshal::v3::XATransactionIdMarshaller::tightUnmarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream * bs ) throw ( decaf::io::IOException ) [virtual]`

Un-marshall an object instance from the data input stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

#### Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v3::TransactionIdMarshaller** (p. 3777).

The documentation for this class was generated from the following file:

### 6.885.1 Detailed Description

Marshaling code for Open Wire Format for **XATransactionIdMarshaller** (p. 3984).

NOTE!: This file is auto generated - do not modify! if you need to make a change, please see the Java Classes in the activemq-openwire-generator module

## 6.885.2 Constructor & Destructor Documentation

6.885.2.1 `activemq::wireformat::openwire::marshal::v5::XATransactionIdMarshaller::XATransactionIdMarshaller ( ) [inline]`

6.885.2.2 `virtual activemq::wireformat::openwire::marshal::v5::XATransactionIdMarshaller::~~XATransactionIdMarshaller ( ) [inline, virtual]`

## 6.885.3 Member Function Documentation

6.885.3.1 `virtual commands::DataStructure* activemq::wireformat::openwire::marshal::v5::XATransactionIdMarshaller::createObject ( ) const [virtual]`

Creates a new instance of this marshalable type.

### Returns

new DataStructure object pointer caller owns it.

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1578).

6.885.3.2 `virtual unsigned char activemq::wireformat::openwire::marshal::v5::XATransactionIdMarshaller::getDataStructureType ( ) const [virtual]`

Get the Data Structure Type that identifies this Marshaler.

### Returns

byte holding the data structure type value

Implements **activemq::wireformat::openwire::marshal::DataStreamMarshaller** (p. 1585).

6.885.3.3 `virtual void activemq::wireformat::openwire::marshal::v5::XATransactionIdMarshaller::looseMarshal ( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure, decaf::io::DataOutputStream * dataOut ) throw ( decaf::io::IOException ) [virtual]`

Write a object instance to data output stream.

### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryWriter that provides that data sink

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v5::TransactionIdMarshaller** (p. 3764).

```
6.885.3.4  virtual void activemq::wireformat::openwire::marshal::v5::XATransactionIdMarshaller::looseUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure,
  decaf::io::DataInputStream * dataIn ) throw ( decaf::io::IOException )
[virtual]
```

Un-marshal an object instance from the data input stream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataIn</i>	- BinaryReader that provides that data source

**Exceptions**

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v5::TransactionIdMarshaller** (p. 3764).

```
6.885.3.5  virtual int activemq::wireformat::openwire::marshal::v5::XATransactionIdMarshaller::tightMarshal1
( OpenWireFormat * wireFormat, commands::DataStructure *
  dataStructure, utils::BooleanStream * bs ) throw ( decaf::io::IOException )
[virtual]
```

Write the booleans that this object uses to a BooleanStream.

**Parameters**

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

**Returns**

int value indicating the size of the marshaled object.

**Exceptions**

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

## 6.885 activemq::wireformat::openwire::marshal::v5::XATransactionIdMarshaller

### Class Reference 4001

Reimplemented from **activemq::wireformat::openwire::marshal::v5::TransactionIdMarshaller** (p. 3765).

```
6.885.3.6 virtual void activemq::wireformat::openwire::marshal::v5::XATransactionIdMarshaller::tightMarshal2
( OpenWireFormat * wireFormat, commands::DataStructure * dataStructure,
  decaf::io::DataOutputStream * dataOut, utils::BooleanStream * bs ) throw
( decaf::io::IOException ) [virtual]
```

Write a object instance to data output stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker
<i>dataStructure</i>	- Object to be marshaled
<i>dataOut</i>	- BinaryReader that provides that data sink
<i>bs</i>	- BooleanStream stream used to pack bits from the wire.

#### Exceptions

<i>IOException</i>	if an error occurs during the marshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v5::TransactionIdMarshaller** (p. 3765).

```
6.885.3.7 virtual void activemq::wireformat::openwire::marshal::v5::XATransactionIdMarshaller::tightUnmarshal
( OpenWireFormat * wireFormat, commands::DataStructure *
  dataStructure, decaf::io::DataInputStream * dataIn, utils::BooleanStream *
  bs ) throw ( decaf::io::IOException ) [virtual]
```

Un-marshall an object instance from the data input stream.

#### Parameters

<i>wireFormat</i>	- describes the wire format of the broker.
<i>dataStructure</i>	- Object to be un-marshaled.
<i>dataIn</i>	- BinaryReader that provides that data.
<i>bs</i>	- BooleanStream stream used to unpack bits from the wire.

#### Exceptions

<i>IOException</i>	if an error occurs during the unmarshal.
--------------------	--

Reimplemented from **activemq::wireformat::openwire::marshal::v5::TransactionIdMarshaller** (p. 3766).

The documentation for this class was generated from the following file:

- src/main/activemq/wireformat/openwire/marshal/v5/**XATransactionIdMarshaller.h**

## 6.886 decaf::util::logging::XMLFormatter Class Reference

Format a **LogRecord** (p. 2370) into a standard XML format.

```
#include <src/main/decaf/util/logging/XMLFormatter.h>
```

Inheritance diagram for decaf::util::logging::XMLFormatter:

### Public Member Functions

- **XMLFormatter** ()
- virtual **~XMLFormatter** ()
- virtual std::string **format** (const **LogRecord** &record) const  
*Converts a **LogRecord** (p. 2370) into an XML string.*
- virtual std::string **getHead** (const **Handler** \*handler)  
*Returns the header string for a set of log records formatted as XML strings, using the output handler's encoding if it is defined, otherwise using the default platform encoding.*
- virtual std::string **getTail** (const **Handler** \*handler)  
*Returns the tail string for a set of log records formatted as XML strings.*

### 6.886.1 Detailed Description

Format a **LogRecord** (p. 2370) into a standard XML format.

TODO - Currently only outputs UTF-8 The **XMLFormatter** (p. 3988) can be used with arbitrary character encodings, but it is recommended that it normally be used with UTF-8. The character encoding can be set on the output **Handler** (p. 1941).

#### Since

1.0

### 6.886.2 Constructor & Destructor Documentation

6.886.2.1 decaf::util::logging::XMLFormatter::XMLFormatter ( )

6.886.2.2 virtual decaf::util::logging::XMLFormatter::~XMLFormatter ( ) [virtual]

### 6.886.3 Member Function Documentation

6.886.3.1 virtual std::string decaf::util::logging::XMLFormatter::format ( const **LogRecord** &record ) const [virtual]

Converts a **LogRecord** (p. 2370) into an XML string.

**Parameters**

<i>record</i>	The log record to be formatted.
---------------	---------------------------------

**Returns**

the log record formatted as an XML string.

Implements **decaf::util::logging::Formatter** (p. 1928).

**6.886.3.2** `virtual std::string decaf::util::logging::XMLFormatter::getHead ( const Handler * handler ) [virtual]`

Returns the header string for a set of log records formatted as XML strings, using the output handler's encoding if it is defined, otherwise using the default platform encoding.

**Parameters**

<i>handler</i>	The output handler, may be NULL.
----------------	----------------------------------

**Returns**

the header string for log records formatted as XML strings.

**6.886.3.3** `virtual std::string decaf::util::logging::XMLFormatter::getTail ( const Handler * handler ) [virtual]`

Returns the tail string for a set of log records formatted as XML strings.

**Parameters**

<i>handler</i>	The output handler, may be NULL.
----------------	----------------------------------

**Returns**

the tail string for log records formatted as XML strings.

The documentation for this class was generated from the following file:

- `src/main/decaf/util/logging/XMLFormatter.h`

## 6.887 `z_stream_s` Struct Reference

```
#include <src/main/decaf/internal/util/zip/zlib.h>
```

**Data Fields**

- **Bytef \* next\_in**

- **uint avail\_in**
- **uLong total\_in**
- **Bytef \* next\_out**
- **uint avail\_out**
- **uLong total\_out**
- **char \* msg**
- **struct internal\_state FAR \* state**
- **alloc\_func zalloc**
- **free\_func zfree**
- **voidpf opaque**
- **int data\_type**
- **uLong Adler**
- **uLong reserved**

#### 6.887.1 Field Documentation

- 6.887.1.1 **uLong z\_stream\_s::Adler**
- 6.887.1.2 **uint z\_stream\_s::avail\_in**
- 6.887.1.3 **uint z\_stream\_s::avail\_out**
- 6.887.1.4 **int z\_stream\_s::data\_type**
- 6.887.1.5 **char\* z\_stream\_s::msg**
- 6.887.1.6 **Bytef\* z\_stream\_s::next\_in**
- 6.887.1.7 **Bytef\* z\_stream\_s::next\_out**
- 6.887.1.8 **voidpf z\_stream\_s::opaque**
- 6.887.1.9 **uLong z\_stream\_s::reserved**
- 6.887.1.10 **struct internal\_state FAR\* z\_stream\_s::state**
- 6.887.1.11 **uLong z\_stream\_s::total\_in**
- 6.887.1.12 **uLong z\_stream\_s::total\_out**
- 6.887.1.13 **alloc\_func z\_stream\_s::zalloc**
- 6.887.1.14 **free\_func z\_stream\_s::zfree**

The documentation for this struct was generated from the following file:

- **src/main/decaf/internal/util/zip/zlib.h**

## 6.888 decaf::util::zip::ZipException Class Reference

```
#include <src/main/decaf/util/zip/ZipException.h>
```

Inheritance diagram for decaf::util::zip::ZipException:

### Public Member Functions

- **ZipException** () throw ()  
*Default Constructor.*
- **ZipException** (const lang::Exception &ex) throw ()  
*Copy Constructor.*
- **ZipException** (const ZipException &ex) throw ()  
*Copy Constructor.*
- **ZipException** (const char \*file, const int lineNumber, const std::exception \*cause, const char \*msg,...) throw ()  
*Constructor - Initializes the file name and line number where this message occurred.*
- **ZipException** (const std::exception \*cause) throw ()  
*Constructor.*
- **ZipException** (const char \*file, const int lineNumber, const char \*msg,...) throw ()  
*Constructor.*
- virtual **ZipException** \* clone () const  
*Clones this exception.*
- virtual ~**ZipException** () throw ()

### 6.888.1 Constructor & Destructor Documentation

6.888.1.1 decaf::util::zip::ZipException::ZipException ( ) throw () [inline]

Default Constructor.

6.888.1.2 decaf::util::zip::ZipException::ZipException ( const lang::Exception & ex ) throw () [inline]

Copy Constructor.

#### Parameters

<i>ex</i>	the exception to copy
-----------	-----------------------

6.888.1.3 `decaf::util::zip::ZipException::ZipException ( const ZipException & ex ) throw ()`  
`[inline]`

Copy Constructor.

#### Parameters

<i>ex</i>	the exception to copy, which is an instance of this type
-----------	--

6.888.1.4 `decaf::util::zip::ZipException::ZipException ( const char * file, const int lineNumber, const std::exception * cause, const char * msg, ... ) throw ()` `[inline]`

Constructor - Initializes the file name and line number where this message occurred.

Sets the message to report, using an optional list of arguments to parse into the message

#### Parameters

<i>file</i>	The file name where exception occurs
<i>lineNumber</i>	The line number where the exception occurred.
<i>cause</i>	The exception that was the cause for this one to be thrown.
<i>msg</i>	The message to report
<i>...</i>	list of primitives that are formatted into the message

6.888.1.5 `decaf::util::zip::ZipException::ZipException ( const std::exception * cause ) throw ()`  
`[inline]`

Constructor.

#### Parameters

<i>cause</i>	Pointer to the exception that caused this one to be thrown, the object is cloned caller retains ownership.
--------------	--

6.888.1.6 `decaf::util::zip::ZipException::ZipException ( const char * file, const int lineNumber, const char * msg, ... ) throw ()` `[inline]`

Constructor.

#### Parameters

<i>file</i>	The file name where exception occurs
<i>lineNumber</i>	The line number where the exception occurred.
<i>msg</i>	The message to report
<i>...</i>	list of primitives that are formatted into the message

6.888.1.7 `virtual decaf::util::zip::ZipException::~~ZipException ( ) throw () [inline, virtual]`

## 6.888.2 Member Function Documentation

6.888.2.1 `virtual ZipException* decaf::util::zip::ZipException::clone ( ) const [inline, virtual]`

Clones this exception.

This is useful for cases where you need to preserve the type of the original exception as well as the message. All subclasses should override.

### Returns

a new instance of an Exception that is a copy of this one.

Reimplemented from **decaf::io::IOException** (p. 2105).

The documentation for this class was generated from the following file:

- `src/main/decaf/util/zip/ZipException.h`

## Chapter 7

# File Documentation

### 7.1 src/main/activemq/cmsutil/CachedConsumer.h File Reference

```
#include <cms/MessageConsumer.h>
#include <activemq/util/Config.h>
```

#### Data Structures

- class **activemq::cmsutil::CachedConsumer**  
*A cached message consumer contained within a pooled session.*

#### Namespaces

- namespace **activemq**  
*Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.*
- namespace **activemq::cmsutil**

### 7.2 src/main/activemq/cmsutil/CachedProducer.h File Reference

```
#include <cms/MessageProducer.h>
#include <activemq/util/Config.h>
```

#### Data Structures

- class **activemq::cmsutil::CachedProducer**  
*A cached message producer contained within a pooled session.*

## Namespaces

- namespace **activemq**  
*Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.*
- namespace **activemq::cmsutil**

## 7.3 src/main/activemq/cmsutil/CmsAccessor.h File Reference

```
#include <cms/ConnectionFactory.h>
#include <activemq/cmsutil/ResourceLifecycleManager.h>
#include <activemq/util/Config.h>
#include <decaf/lang/exceptions/IllegalStateException.h>
```

## Data Structures

- class **activemq::cmsutil::CmsAccessor**  
*Base class for **activemq.cmsutil.CmsTemplate** (p. 1140) and other CMS-accessing gateway helpers, defining common properties such as the CMS **cms.ConnectionFactory** (p. 1294) to operate on.*

## Namespaces

- namespace **activemq**  
*Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.*
- namespace **activemq::cmsutil**

## 7.4 src/main/activemq/cmsutil/CmsDestinationAccessor.h File Reference

```
#include <activemq/util/Config.h>
#include <activemq/cmsutil/CmsAccessor.h>
#include <activemq/cmsutil/DynamicDestinationResolver.h>
```

## Data Structures

- class **activemq::cmsutil::CmsDestinationAccessor**  
*Extends the **CmsAccessor** (p. 1123) to add support for resolving destination names.*

## Namespaces

- namespace **activemq**  
*Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.*
- namespace **activemq::cmsutil**

## 7.5 src/main/activemq/cmsutil/CmsTemplate.h File Reference

```
#include <activemq/util/Config.h>
#include <activemq/cmsutil/CmsDestinationAccessor.h>
#include <activemq/cmsutil/SessionCallback.h>
#include <activemq/cmsutil/ProducerCallback.h>
#include <activemq/cmsutil/SessionPool.h>
#include <decaf/lang/exceptions/IllegalStateException.h>
#include <cms/ConnectionFactory.h>
#include <cms/DeliveryMode.h>
#include <string>
```

## Data Structures

- class **activemq::cmsutil::CmsTemplate**  
***CmsTemplate** (p. 1140) simplifies performing synchronous CMS operations.*
- class **activemq::cmsutil::CmsTemplate::ProducerExecutor**
- class **activemq::cmsutil::CmsTemplate::ResolveProducerExecutor**
- class **activemq::cmsutil::CmsTemplate::SendExecutor**
- class **activemq::cmsutil::CmsTemplate::ReceiveExecutor**

*Macro for catching an exception of one type and then re-throwing as another type.*
- #define **AMQ\_CATCHALL\_THROW**(type)  
*A catch-all that throws a known exception.*
- #define **AMQ\_CATCHALL\_NOTHROW**()  
*A catch-all that does not throw an exception, one use would be to catch any exception in a destructor and mark it, but not throw so that cleanup would continue as normal.*
- #define **AMQ\_CATCH\_NOTHROW**(type)  
*Macro for catching and re-throwing an exception of a given type.*

### 7.104.1 Define Documentation

#### 7.104.1.1 `#define AMQ_CATCH_EXCEPTION_CONVERT( sourceType, targetType )`

##### Value:

```
catch( sourceType& ex ){ \
    targetType target( ex ); \
    target.setMark( __FILE__, __LINE__ ); \
    throw target; \
}
```

Macro for catching an exception of one type and then re-throwing as another type.

##### Parameters

<i>sourceType</i>	the type of the exception to be caught.
<i>targetType</i>	the type of the exception to be thrown.

Referenced by `activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::looseMarshalObjectArray()`, `activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalObjectArray1()`, and `activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalObjectArray2()`.

#### 7.104.1.2 `#define AMQ_CATCH_NOTHROW( type )`

##### Value:

```
catch( type& ex ){ \
    ex.setMark( __FILE__, __LINE__ ); \
}
```

Macro for catching and re-throwing an exception of a given type.

##### Parameters

<i>type</i>	The type of the exception to throw (e.g. <code>ActiveMQException</code> ).
-------------	--

#### 7.104.1.3 `#define AMQ_CATCH_RETHROW( type )`

##### Value:

```
catch( type& ex ){ \
    ex.setMark( __FILE__, __LINE__ ); \
    throw ex; \
}
```

Macro for catching and re-throwing an exception of a given type.

##### Parameters

<i>type</i>	The type of the exception to throw (e.g. <code>ActiveMQException</code> ).
-------------	--

Referenced by `activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::looseMarshalObjectArray()`, `activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalObjectArray1()`, and `activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalObjectArray2()`.

#### 7.104.1.4 #define AMQ\_CATCHALL\_NOTHROW( )

##### Value:

```
catch( ... ){ \
    activemq::exceptions::ActiveMQException ex( __FILE__, __LINE__, \
        "caught unknown exception, not rethrowing" ); \
}
```

A catch-all that does not throw an exception, one use would be to catch any exception in a destructor and mark it, but not throw so that cleanup would continue as normal.

#### 7.104.1.5 #define AMQ\_CATCHALL\_THROW( type )

##### Value:

```
catch( ... ){ \
    type ex( __FILE__, __LINE__, \
        "caught unknown exception" ); \
    throw ex; \
}
```

A catch-all that throws a known exception.

##### Parameters

<i>type</i>	the type of exception to be thrown.
-------------	-------------------------------------

Referenced by `activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::looseMarshalObjectArray()`, `activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalObjectArray1()`, and `activemq::wireformat::openwire::marshal::BaseDataStreamMarshaller::tightMarshalObjectArray2()`.

## 7.105 src/main/decaf/lang/exceptions/ExceptionDefines.h File Reference

### Defines

- #define **DECAF\_CATCH\_RETHROW**(type)  
*Macro for catching and rethrowing an exception of a given type.*
- #define **DECAF\_CATCH\_EXCEPTION\_CONVERT**(sourceType, targetType)  
*Macro for catching an exception of one type and then rethrowing as another type.*
- #define **DECAF\_CATCHALL\_THROW**(type)  
*A catch-all that throws a known exception.*

- **#define DECAF\_CATCHALL\_NOTHROW()**  
*A catch-all that does not throw an exception, one use would be to catch any exception in a destructor and mark it, but not throw so that cleanup would continue as normal.*
- **#define DECAF\_CATCH\_NOTHROW(type)**  
*Macro for catching and rethrowing an exception of a given type.*

### 7.105.1 Define Documentation

#### 7.105.1.1 #define DECAF\_CATCH\_EXCEPTION\_CONVERT( sourceType, targetType )

##### Value:

```
catch( sourceType& ex ){ \
    targetType target( &ex ); \
    target.setMark( __FILE__, __LINE__ ); \
    throw target; \
}
```

Macro for catching an exception of one type and then rethrowing as another type.

##### Parameters

<i>sourceType</i>	the type of the exception to be caught.
<i>targetType</i>	the type of the exception to be thrown.

Referenced by `decaf::util::PriorityQueue< E >::add()`.

#### 7.105.1.2 #define DECAF\_CATCH\_NOTHROW( type )

##### Value:

```
catch( type& ex ){ \
    ex.setMark( __FILE__, __LINE__ ); \
}
```

Macro for catching and rethrowing an exception of a given type.

##### Parameters

<i>type</i>	The type of the exception to throw (e.g. Exception ).
-------------	---

#### 7.105.1.3 #define DECAF\_CATCH\_RETHROW( type )

##### Value:

```
catch( type& ex ){ \
    ex.setMark( __FILE__, __LINE__ ); \
    throw ex; \
}
```

Macro for catching and rethrowing an exception of a given type.

#### Parameters

<i>type</i>	The type of the exception to throw (e.g. <code>Exception</code> ).
-------------	--

Referenced by `decaf::util::PriorityQueue< E >::add()`.

##### 7.105.1.4 `#define DECAF_CATCHALL_NOTHROW( )`

#### Value:

```
catch( ... ){ \
    lang::Exception ex( __FILE__, __LINE__, \
        "caught unknown exception, not rethrowing" ); \
}
```

A catch-all that does not throw an exception, one use would be to catch any exception in a destructor and mark it, but not throw so that cleanup would continue as normal.

##### 7.105.1.5 `#define DECAF_CATCHALL_THROW( type )`

#### Value:

```
catch( ... ){ \
    type ex( __FILE__, __LINE__, \
        "caught unknown exception" ); \
    throw ex; \
}
```

A catch-all that throws a known exception.

#### Parameters

<i>type</i>	the type of exception to be thrown.
-------------	-------------------------------------

Referenced by `decaf::util::PriorityQueue< E >::add()`.

#include <cms/MessageNotReadableException.h>
#include <cms/MessageNotWritableException.h>
#include <cms/MessageEOFException.h>
#include <cms/MessageFormatException.h>
```

### Data Structures

- class **cms::BytesMessage**

A **BytesMessage** (p. 1023) object is used to send a message containing a stream of unsigned bytes.

## Namespaces

- namespace **cms**

*Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.*

## 7.562 src/main/cms/Closeable.h File Reference

```
#include <cms/Config.h>
#include <cms/CMSException.h>
```

## Data Structures

- class **cms::Closeable**

*Interface for a class that implements the close method.*

## Namespaces

- namespace **cms**

*Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.*

## 7.563 src/main/decaf/io/Closeable.h File Reference

```
#include <decaf/util/Config.h>
#include <decaf/io/IOException.h>
```

## Data Structures

- class **decaf::io::Closeable**

*Interface for a class that implements the close method.*

## Namespaces

- namespace **decaf**

*Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.*

- namespace **decaf::io**

## 7.564 src/main/cms/CMSException.h File Reference

```
#include <string>
#include <vector>
#include <iostream>
#include <exception>
#include <cms/Config.h>
```

### Data Structures

- class **cms::CMSException**

*CMS API Exception that is the base for all exceptions thrown from CMS classes.*

### Namespaces

- namespace **cms**

*Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.*

## 7.565 src/main/cms/CMSProperties.h File Reference

```
#include <cms/Config.h>
#include <map>
#include <string>
#include <vector>
```

### Data Structures

- class **cms::CMSProperties**

*Interface for a Java-like properties object.*

### Namespaces

- namespace **cms**

*Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.*

## 7.566 src/main/cms/CMSSecurityException.h File Reference

```
#include <cms/Config.h>
#include <cms/CMSException.h>
```

### Data Structures

- class **cms::CMSSecurityException**

*This exception must be thrown when a provider rejects a user name/password submitted by a client.*

### Namespaces

- namespace **cms**

*Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.*

## 7.567 src/main/cms/Connection.h File Reference

```
#include <cms/Config.h>
#include <cms/Startable.h>
#include <cms/Stoppable.h>
#include <cms/Closeable.h>
#include <cms/Session.h>
#include <cms/ConnectionMetaData.h>
```

### Data Structures

- class **cms::Connection**

*The client's connection to its provider.*

### Namespaces

- namespace **cms**

*Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.*

## 7.568 src/main/cms/ConnectionFactory.h File Reference

```
#include <cms/Config.h>
#include <cms/Connection.h>
#include <cms/CMSException.h>
#include <string>
```

### Data Structures

- class **cms::ConnectionFactory**

*Defines the interface for a factory that creates connection objects, the **Connection** (p. 1232) objects returned implement the CMS **Connection** (p. 1232) interface and hide the CMS Provider specific implementation details behind that interface.*

### Namespaces

- namespace **cms**

*Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.*

## 7.569 src/main/cms/ConnectionMetaData.h File Reference

```
#include <cms/Config.h>
#include <cms/CMSException.h>
```

### Data Structures

- class **cms::ConnectionMetaData**

*A **ConnectionMetaData** (p. 1355) object provides information describing the **Connection** (p. 1232) object.*

### Namespaces

- namespace **cms**

*Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.*

## 7.570 src/main/cms/DeliveryMode.h File Reference

```
#include <cms/Config.h>
```

## Data Structures

- class **cms::DeliveryMode**

*This is an Abstract class whose purpose is to provide a container for the delivery mode enumeration for CMS messages.*

## Namespaces

- namespace **cms**

*Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.*

## 7.571 src/main/cms/Destination.h File Reference

```
#include <cms/CMSProperties.h>
#include <cms/Config.h>
#include <string>
```

## Data Structures

- class **cms::Destination**

*A **Destination** (p. 1688) object encapsulates a provider-specific address.*

## Namespaces

- namespace **cms**

*Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.*

## 7.572 src/main/cms/ExceptionListener.h File Reference

```
#include <cms/Config.h>
#include <cms/CMSException.h>
```

## Data Structures

- class **cms::ExceptionListener**

*If a CMS provider detects a serious problem, it notifies the client application through an **ExceptionListener** (p. 1801) that is registered with the **Connection** (p. 1232).*

## Namespaces

- namespace **cms**

*Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.*

## 7.573 src/main/cms/IllegalStateException.h File Reference

```
#include <cms/Config.h>
#include <cms/CMSException.h>
```

## Data Structures

- class **cms::IllegalStateException**

*This exception is thrown when a method is invoked at an illegal or inappropriate time or if the provider is not in an appropriate state for the requested operation.*

## Namespaces

- namespace **cms**

*Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.*

## 7.574 src/main/decaf/lang/exceptions/IllegalStateException.h File Reference

```
#include <decaf/lang/Exception.h>
```

## Data Structures

- class **decaf::lang::exceptions::IllegalStateException**

## Namespaces

- namespace **decaf**

*Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.*

- namespace **decaf::lang**
- namespace **decaf::lang::exceptions**

## 7.575 src/main/cms/InvalidClientIdException.h File Reference

```
#include <cms/Config.h>
#include <cms/CMSException.h>
```

### Data Structures

- class **cms::InvalidClientIdException**

*This exception must be thrown when a client attempts to set a connection's client ID to a value that is rejected by a provider.*

### Namespaces

- namespace **cms**

*Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.*

## 7.576 src/main/cms/InvalidDestinationException.h File Reference

```
#include <cms/Config.h>
#include <cms/CMSException.h>
```

### Data Structures

- class **cms::InvalidDestinationException**

*This exception must be thrown when a destination either is not understood by a provider or is no longer valid.*

### Namespaces

- namespace **cms**

*Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.*

## 7.577 src/main/cms/InvalidSelectorException.h File Reference

```
#include <cms/Config.h>
#include <cms/CMSException.h>
```

## Data Structures

- class **cms::InvalidSelectorException**

*This exception must be thrown when a CMS client attempts to give a provider a message selector with invalid syntax.*

## Namespaces

- namespace **cms**

*Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.*

## 7.578 src/main/cms/MapMessage.h File Reference

```
#include <cms/Config.h>
#include <cms/Message.h>
#include <cms/CMSException.h>
#include <cms/MessageFormatException.h>
#include <cms/MessageNotWriteableException.h>
```

## Data Structures

- class **cms::MapMessage**

*A **MapMessage** (p. 2431) object is used to send a set of name-value pairs.*

## Namespaces

- namespace **cms**

*Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.*

## 7.579 src/main/cms/MessageConsumer.h File Reference

```
#include <cms/Config.h>
#include <cms/MessageListener.h>
#include <cms/Message.h>
#include <cms/Closeable.h>
```

## Data Structures

- class **cms::MessageConsumer**

*A client uses a **MessageConsumer** (p. 2550) to received messages from a destination.*

## Namespaces

- namespace **cms**

*Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.*

## 7.580 src/main/cms/MessageEnumeration.h File Reference

```
#include <cms/Config.h>
#include <cms/Message.h>
#include <cms/CMSException.h>
```

## Data Structures

- class **cms::MessageEnumeration**

*Defines an object that enumerates a collection of Messages.*

## Namespaces

- namespace **cms**

*Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.*

## 7.581 src/main/cms/MessageEOFException.h File Reference

```
#include <cms/Config.h>
#include <cms/CMSException.h>
```

## Data Structures

- class **cms::MessageEOFException**

*This exception must be thrown when an unexpected end of stream has been reached when a **StreamMessage** (p. 3595) or **BytesMessage** (p. 1023) is being read.*

## Namespaces

- namespace **cms**

*Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.*

## 7.582 src/main/cms/MessageFormatException.h File Reference

```
#include <cms/Config.h>
#include <cms/CMSException.h>
```

## Data Structures

- class **cms::MessageFormatException**

*This exception must be thrown when a CMS client attempts to use a data type not supported by a message or attempts to read data in a message as the wrong type.*

## Namespaces

- namespace **cms**

*Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.*

## 7.583 src/main/cms/MessageListener.h File Reference

```
#include <cms/Config.h>
```

## Data Structures

- class **cms::MessageListener**

*A **MessageListener** (p. 2652) object is used to receive asynchronously delivered messages.*

## Namespaces

- namespace **cms**

*Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.*

## 7.584 src/main/cms/MessageNotReadableException.h File Reference

```
#include <cms/Config.h>
#include <cms/CMSException.h>
```

### Data Structures

- class **cms::MessageNotReadableException**  
*This exception must be thrown when a CMS client attempts to read a write-only message.*

### Namespaces

- namespace **cms**  
*Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.*

## 7.585 src/main/cms/MessageNotWriteableException.h File Reference

```
#include <cms/Config.h>
#include <cms/CMSException.h>
```

### Data Structures

- class **cms::MessageNotWriteableException**  
*This exception must be thrown when a CMS client attempts to write to a read-only message.*

### Namespaces

- namespace **cms**  
*Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.*

#include <decaf/util/AbstractCollection.h>
#include <decaf/lang/Exception.h>
#include <decaf/lang/exceptions/NoSuchElementException.h>
#include <decaf/lang/exceptions/IndexOutOfBoundsException.h>
```

## Data Structures

- class **decaf::util::Queue< E >**

*A kind of collection provides advanced operations than other basic collections, such as insertion, extraction, and inspection.*

## Namespaces

- namespace **decaf**

*Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.*

- namespace **decaf::util**

## 7.590 src/main/cms/QueueBrowser.h File Reference

```
#include <string>
#include <cms/Config.h>
#include <cms/Closeable.h>
#include <cms/Queue.h>
```

```
#include <cms/Message.h>
#include <cms/CMSException.h>
#include <cms/MessageEnumeration.h>
```

## Data Structures

- class **cms::QueueBrowser**

*This class implements in interface for browsing the messages in a **Queue** (p. 3093) without removing them.*

## Namespaces

- namespace **cms**

*Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.*

## 7.591 src/main/cms/Session.h File Reference

```
#include <cms/Config.h>
#include <cms/Closeable.h>
#include <cms/Message.h>
#include <cms/TextMessage.h>
#include <cms/BytesMessage.h>
#include <cms/MapMessage.h>
#include <cms/StreamMessage.h>
#include <cms/MessageProducer.h>
#include <cms/MessageConsumer.h>
#include <cms/Topic.h>
#include <cms/Queue.h>
#include <cms/QueueBrowser.h>
#include <cms/TemporaryTopic.h>
#include <cms/TemporaryQueue.h>
#include <cms/CMSException.h>
```

## Data Structures

- class **cms::Session**

A **Session** (p. 3305) object is a single-threaded context for producing and consuming messages.

## Namespaces

- namespace **cms**

*Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.*

## 7.592 src/main/cms/Startable.h File Reference

```
#include <cms/Config.h>
#include <cms/CMSException.h>
```

## Data Structures

- class **cms::Startable**

*Interface for a class that implements the start method.*

## Namespaces

- namespace **cms**

*Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.*

## 7.593 src/main/cms/Stopable.h File Reference

```
#include <cms/Config.h>
#include <cms/CMSException.h>
```

## Data Structures

- class **cms::Stopable**

*Interface for a class that implements the stop method.*

## Namespaces

- namespace **cms**

*Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.*

## 7.594 src/main/cms/StreamMessage.h File Reference

```
#include <cms/Config.h>
#include <cms/Message.h>
#include <cms/CMSException.h>
#include <cms/MessageNotReadableException.h>
#include <cms/MessageNotWritableException.h>
#include <cms/MessageFormatException.h>
#include <cms/MessageEOFException.h>
```

### Data Structures

- class **cms::StreamMessage**  
*Interface for a **StreamMessage** (p. 3595).*

### Namespaces

- namespace **cms**  
*Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.*

## 7.595 src/main/cms/TemporaryQueue.h File Reference

```
#include <cms/Config.h>
#include <cms/Destination.h>
#include <cms/CMSException.h>
```

### Data Structures

- class **cms::TemporaryQueue**  
*Defines a Temporary **Queue** (p. 3093) based **Destination** (p. 1688).*

### Namespaces

- namespace **cms**  
*Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.*

## 7.596 src/main/cms/TemporaryTopic.h File Reference

```
#include <cms/Config.h>
#include <cms/Destination.h>
#include <cms/CMSException.h>
```

### Data Structures

- class **cms::TemporaryTopic**  
*Defines a Temporary **Topic** (p. 3757) based **Destination** (p. 1688).*

### Namespaces

- namespace **cms**  
*Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.*

## 7.597 src/main/cms/TextMessage.h File Reference

```
#include <cms/Config.h>
#include <cms/Message.h>
#include <cms/CMSException.h>
#include <cms/MessageNotWriteableException.h>
```

### Data Structures

- class **cms::TextMessage**  
*Interface for a text message.*

### Namespaces

- namespace **cms**  
*Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.*

## 7.598 src/main/cms/Topic.h File Reference

```
#include <cms/Config.h>
#include <cms/Destination.h>
```

```
#include <cms/CMSException.h>
```

## Data Structures

- class **cms::Topic**

*An interface encapsulating a provider-specific topic name.*

## Namespaces

- namespace **cms**

*Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.*

## 7.599 src/main/cms/UnsupportedOperationException.h File Reference

```
#include <cms/Config.h>
```

```
#include <cms/CMSException.h>
```

## Data Structures

- class **cms::UnsupportedOperationException**

*This exception must be thrown when a CMS client attempts use a CMS method that is not implemented or not supported by the CMS Provider in use.*

## Namespaces

- namespace **cms**

*Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.*

## 7.600 src/main/decaf/lang/exceptions/UnsupportedOperationException.h File Reference

```
#include <decaf/lang/Exception.h>
```

## Data Structures

- class **decaf::lang::exceptions::UnsupportedOperationException**

## Namespaces

- namespace **decaf**

*Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.*

*Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.*

- namespace **decaf::internal**
- namespace **decaf::internal::io**

## 7.605 src/main/decaf/internal/io/StandardOutputStream.h File Reference

```
#include <decaf/util/Config.h>
#include <decaf/io/OutputStream.h>
```

### Data Structures

- class **decaf::internal::io::StandardOutputStream**

### Namespaces

- namespace **decaf**  
*Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.*
- namespace **decaf::internal**
- namespace **decaf::internal::io**

## 7.606 src/main/decaf/internal/net/DefaultServerSocketFactory.h File Reference

```
#include <decaf/util/Config.h>
#include <decaf/net/ServerSocketFactory.h>
```

### Data Structures

- class **decaf::internal::net::DefaultServerSocketFactory**  
*Default implementation of the Decaf ServerSocketFactory, creates ServerSocket objects with supplied options.*

### Namespaces

- namespace **decaf**  
*Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.*

- namespace **decaf::internal**
- namespace **decaf::internal::net**

## 7.607 src/main/decaf/internal/net/DefaultSocketFactory.h File Reference

```
#include <decaf/util/Config.h>
#include <decaf/net/SocketFactory.h>
```

### Data Structures

- class **decaf::internal::net::DefaultSocketFactory**  
*SocketFactory implementation that is used to create Sockets.*

### Namespaces

- namespace **decaf**  
*Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.*
- namespace **decaf::internal**
- namespace **decaf::internal::net**

## 7.608 src/main/decaf/internal/net/Network.h File Reference

```
#include <decaf/util/Config.h>
#include <decaf/util/concurrent/Mutex.h>
#include <decaf/internal/util/Resource.h>
#include <decaf/internal/util/GenericResource.h>
```

### Data Structures

- class **decaf::internal::net::Network**  
*Internal class used to manage Networking related resources and hide platform dependent calls from the higher level API.*

### Namespaces

- namespace **decaf**  
*Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.*

- namespace **decaf::internal**
- namespace **decaf::internal::net**

## 7.609 src/main/decaf/internal/net/SocketFileDescriptor.h File Reference

```
#include <decaf/util/Config.h>
#include <decaf/io/FileDescriptor.h>
```

### Data Structures

- class **decaf::internal::net::SocketFileDescriptor**  
*File Descriptor type used internally by Decaf Socket objects.*

### Namespaces

- namespace **decaf**  
*Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.*
- namespace **decaf::internal**
- namespace **decaf::internal::net**

## 7.610 src/main/decaf/internal/net/ssl/DefaultSSLContext.h File Reference

```
#include <decaf/util/Config.h>
#include <decaf/net/ssl/SSLContext.h>
```

### Data Structures

- class **decaf::internal::net::ssl::DefaultSSLContext**  
*Default SSLContext manager for the Decaf library.*

### Namespaces

- namespace **decaf**  
*Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.*

7.663.3.3 voidpf ZLIB\_INTERNAL zcalloc OF ( (voidpf opaque, unsigned items, unsigned size) )

7.663.3.4 void ZLIB\_INTERNAL zmemzero OF ( (Bytef \*dest, uInt len) )

7.663.3.5 int ZLIB\_INTERNAL zmemcmp OF ( (const Bytef \*s1, const Bytef \*s2, uInt len) )

7.663.3.6 void ZLIB\_INTERNAL zmemcpy OF ( (Bytef \*dest, const Bytef \*source, uInt len) )

### 7.663.4 Variable Documentation

7.663.4.1 const char\* const z\_errmsg[10]

## 7.664 src/main/decaf/io/BlockingByteArrayInputStream.h File Reference

```
#include <decaf/io/InputStream.h>
```

```
#include <vector>
```

### Data Structures

- class **decaf::io::BlockingByteArrayInputStream**

*This is a blocking version of a byte buffer stream.*

### Namespaces

- namespace **decaf**

*Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.*

- namespace **decaf::io**

## 7.665 src/main/decaf/io/BufferedInputStream.h File Reference

```
#include <decaf/util/Config.h>
#include <decaf/io/FilterInputStream.h>
#include <decaf/lang/exceptions/IllegalArgumentException.h>
```

### Data Structures

- class **decaf::io::BufferedInputStream**

*A wrapper around another input stream that performs a buffered read, where it reads more data than it needs in order to reduce the number of io operations on the input stream.*

### Namespaces

- namespace **decaf**

*Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.*

- namespace **decaf::io**

## 7.666 src/main/decaf/io/BufferedOutputStream.h File Reference

```
#include <decaf/io/FilterOutputStream.h>
#include <decaf/lang/exceptions/IllegalArgumentException.h>
```

### Data Structures

- class **decaf::io::BufferedOutputStream**

*Wrapper around another output stream that buffers output before writing to the target output stream.*

### Namespaces

- namespace **decaf**

*Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.*

- namespace **decaf::io**

## 7.667 src/main/decaf/io/ByteArrayInputStream.h File Reference

```
#include <decaf/io/InputStream.h>
#include <decaf/util/concurrent/Mutex.h>
#include <vector>
```

### Data Structures

- class **decaf::io::ByteArrayInputStream**

*A **ByteArrayInputStream** (p. 984) contains an internal buffer that contains bytes that may be read from the stream.*

### Namespaces

- namespace **decaf**

*Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.*

- namespace **decaf::io**

## 7.668 src/main/decaf/io/ByteArrayOutputStream.h File Reference

```
#include <decaf/util/Config.h>
#include <decaf/io/OutputStream.h>
#include <decaf/lang/exceptions/IllegalArgumentException.h>
#include <utility>
```

### Data Structures

- class **decaf::io::ByteArrayOutputStream**

### Namespaces

- namespace **decaf**

*Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.*

- namespace **decaf::io**

## 7.669 src/main/decaf/io/DataInput.h File Reference

```
#include <decaf/util/Config.h>
#include <vector>
#include <string>
#include <decaf/io/IOException.h>
#include <decaf/io/EOFException.h>
#include <decaf/io/UTFDataFormatException.h>
#include <decaf/lang/exceptions/NullPointerException.h>
#include <decaf/lang/exceptions/IndexOutOfBoundsException.h>
```

### Data Structures

- class **decaf::io::DataInput**

*The **DataInput** (p. 1523) interface provides for reading bytes from a binary stream and reconstructing from them data in any of the C++ primitive types.*

### Namespaces

- namespace **decaf**

*Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.*

- namespace **decaf::io**

## 7.670 src/main/decaf/io/DataInputStream.h File Reference

```
#include <decaf/io/FilterInputStream.h>
#include <decaf/io/IOException.h>
#include <decaf/io/EOFException.h>
#include <decaf/io/UTFDataFormatException.h>
#include <decaf/lang/exceptions/NullPointerException.h>
#include <decaf/lang/exceptions/IndexOutOfBoundsException.h>
```

### Data Structures

- class **decaf::io::DataInputStream**

*A data input stream lets an application read primitive Java data types from an underlying input stream in a machine-independent way.*

## Namespaces

- namespace **decaf**

*Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.*

- namespace **decaf::io**

## 7.671 src/main/decaf/io/DataOutput.h File Reference

```
#include <decaf/util/Config.h>
#include <vector>
#include <string>
#include <decaf/io/IOException.h>
#include <decaf/io/EOFException.h>
#include <decaf/lang/exceptions/NullPointerException.h>
#include <decaf/lang/exceptions/IndexOutOfBoundsException.h>
```

## Data Structures

- class **decaf::io::DataOutput**

*The **DataOutput** (p. 1541) interface provides for converting data from any of the C++ primitive types to a series of bytes and writing these bytes to a binary stream.*

## Namespaces

- namespace **decaf**

*Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.*

- namespace **decaf::io**

## 7.672 src/main/decaf/io/DataOutputStream.h File Reference

```
#include <decaf/io/FilterOutputStream.h>
#include <decaf/io/IOException.h>
#include <decaf/io/UTFDataFormatException.h>
#include <string>
```

## Data Structures

- class **decaf::io::DataOutputStream**

*A data output stream lets an application write primitive Java data types to an output stream in a portable way.*

## Namespaces

- namespace **decaf**

*Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.*

- namespace **decaf::io**

## 7.673 src/main/decaf/io/EOFException.h File Reference

```
#include <decaf/io/IOException.h>
```

## Data Structures

- class **decaf::io::EOFException**

## Namespaces

- namespace **decaf**

*Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.*

- namespace **decaf::io**

## 7.674 src/main/decaf/io/FileDescriptor.h File Reference

```
#include <decaf/util/Config.h>
```

## Data Structures

- class **decaf::io::FileDescriptor**

*This class serves as an opaque wrapper around an underlying OS level resource that can be used as a source / sink for byte level data such as sockets and files.*

## Namespaces

- namespace **decaf**

*Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.*

- namespace **decaf::io**

## 7.675 src/main/decaf/io/FilterInputStream.h File Reference

```
#include <decaf/io/InputStream.h>
#include <decaf/io/IOException.h>
#include <decaf/lang/exceptions/NullPointerException.h>
#include <decaf/lang/exceptions/IndexOutOfBoundsException.h>
```

## Data Structures

- class **decaf::io::FilterInputStream**

*A **FilterInputStream** (p. 1854) contains some other input stream, which it uses as its basic source of data, possibly transforming the data along the way or providing additional functionality.*

## Namespaces

- namespace **decaf**

*Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.*

- namespace **decaf::io**

## 7.676 src/main/decaf/io/FilterOutputStream.h File Reference

```
#include <decaf/io/OutputStream.h>
#include <decaf/io/IOException.h>
#include <decaf/lang/exceptions/NullPointerException.h>
#include <decaf/lang/exceptions/IndexOutOfBoundsException.h>
```

## Data Structures

- class **decaf::io::FilterOutputStream**

*This class is the superclass of all classes that filter output streams.*

## Namespaces

- namespace **decaf**  
*Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.*
- namespace **decaf::io**

## 7.677 src/main/decaf/io/Flushable.h File Reference

```
#include <decaf/util/Config.h>
#include <decaf/io/IOException.h>
```

## Data Structures

- class **decaf::io::Flushable**  
*A **Flushable** (p. 1899) is a destination of data that can be flushed.*

## Namespaces

- namespace **decaf**  
*Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.*

#include <decaf/util/concurrent/Mutex.h>
#include <decaf/util/Config.h>
#include <decaf/lang/exceptions/NullPointerException.h>
#include <decaf/lang/exceptions/IndexOutOfBoundsException.h>
```

### Data Structures

- class **decaf::io::OutputStream**  
*Base interface for any class that wants to represent an output stream of bytes.*

### Namespaces

- namespace **decaf**  
*Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.*
- namespace **decaf::io**

## 7.683 src/main/decaf/io/OutputStreamWriter.h File Reference

```
#include <decaf/util/Config.h>
#include <decaf/io/Writer.h>
```

### Data Structures

- class **decaf::io::OutputStreamWriter**  
*A class for turning a character stream into a byte stream.*

### Namespaces

- namespace **decaf**  
*Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.*
- namespace **decaf::io**

## 7.684 src/main/decaf/io/PushbackInputStream.h File Reference

```
#include <decaf/util/Config.h>
#include <decaf/io/InputStream.h>
#include <decaf/io/FilterInputStream.h>
```

### Data Structures

- class **decaf::io::PushbackInputStream**  
*A **PushbackInputStream** (p. 3086) adds functionality to another input stream, namely the ability to "push back" or "unread" one byte.*

### Namespaces

- namespace **decaf**  
*Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.*

### Defines

- #define **WAIT\_INFINITE** 0xFFFFFFFF  
*The synchronized macro defines a mechanism for synchronizing a section of code.*
- #define **synchronized(W)**

#### 7.810.1 Define Documentation

##### 7.810.1.1 #define synchronized( W )

###### Value:

```
if(false){} \
else \
for( decaf::util::concurrent::Lock lock_W(W); \
    lock_W.isLocked(); lock_W.unlock() )
```

##### 7.810.1.2 #define WAIT\_INFINITE 0xFFFFFFFF

The synchronized macro defines a mechanism for synchronizing a section of code.

The macro must be passed an object that implements the Synchronizable interface.

The macro works by creating a for loop that will loop exactly once, creating a Lock object that is scoped to the loop. Once the loop completes and exits the Lock object goes out of scope releasing the lock on object W. For added safety the if else is used because not all compilers restrict the lifetime of loop variables to the loop, they will however restrict them to the scope of the else.

The macro would be used as follows.

Synchronizable X;

```
somefunction() { synchronized(X) (p. 4511) { // Do something that needs synchronizing.
} }
```

## 7.811 src/main/decaf/util/concurrent/ConcurrentMap.h File Reference

- namespace **decaf::util**
- namespace **decaf::util::logging**

## Enumerations

- enum **decaf::util::logging::Levels** {  
**decaf::util::logging::Off**, **decaf::util::logging::Null**, **decaf::util::logging::Markblock**,  
**decaf::util::logging::Debug**,  
**decaf::util::logging::Info**, **decaf::util::logging::Warn**, **decaf::util::logging::Error**,  
**decaf::util::logging::Fatal**,  
**decaf::util::logging::Throwing** }

*Defines an enumeration for logging levels.*

## 7.850 src/main/decaf/util/logging/LoggerDefines.h File Reference

```
#include <decaf/util/logging/SimpleLogger.h>
#include <sstream>
```

## Defines

- #define **LOGDECAF\_DECLARE**(loggerName) static **decaf::util::logging::SimpleLogger** loggerName;
- #define **LOGDECAF\_INITIALIZE**(loggerName, className, loggerFamily) **decaf::util::logging::SimpleLogger** className::loggerName(loggerFamily);
- #define **LOGDECAF\_DECLARE\_LOCAL**(loggerName) **decaf::util::logging::Logger** loggerName;
- #define **LOGDECAF\_DEBUG**(logger, message) logger.debug(\_\_FILE\_\_, \_\_LINE\_\_, message);
- #define **LOGDECAF\_DEBUG\_1**(logger, message, value)
- #define **LOGDECAF\_INFO**(logger, message) logger.info(\_\_FILE\_\_, \_\_LINE\_\_, message);
- #define **LOGDECAF\_ERROR**(logger, message) logger.error(\_\_FILE\_\_, \_\_LINE\_\_, message);
- #define **LOGDECAF\_WARN**(logger, message) logger.warn(\_\_FILE\_\_, \_\_LINE\_\_, message);
- #define **LOGDECAF\_FATAL**(logger, message) logger.fatal(\_\_FILE\_\_, \_\_LINE\_\_, message);

### 7.850.1 Define Documentation

7.850.1.1 #define **LOGDECAF\_DEBUG**( *logger, message* ) logger.debug(\_\_FILE\_\_, \_\_LINE\_\_, message);

7.850.1.2 #define **LOGDECAF\_DEBUG\_1**( *logger, message, value* )

**Value:**

```

;
{
    std::ostream ostream;
    ostream << message << value;
    logger.debug(__FILE__, __LINE__, ostream.str());
}

```

7.850.1.3 `#define LOGDECAF_DECLARE( loggerName ) static  
decaf::util::logging::SimpleLogger loggerName;`

7.850.1.4 `#define LOGDECAF_DECLARE_LOCAL( loggerName  
) decaf::util::logging::Logger loggerName;`

7.850.1.5 `#define LOGDECAF_ERROR( logger, message ) logger.error(__FILE__, __LINE__,  
message);`

7.850.1.6 `#define LOGDECAF_FATAL( logger, message ) logger.fatal(__FILE__, __LINE__,  
message);`

7.850.1.7 `#define LOGDECAF_INFO( logger, message ) logger.info(__FILE__, __LINE__,  
message);`

7.850.1.8 `#define LOGDECAF_INITIALIZE( loggerName, className, loggerFamily  
) decaf::util::logging::SimpleLogger className::loggerName(loggerFamily);`

7.850.1.9 `#define LOGDECAF_WARN( logger, message ) logger.warn(__FILE__, __LINE__,  
message);`

## 7.881 src/main/decaf/util/zip/DeflaterOutputStream.h File Reference

```
#include <decaf/util/Config.h>
#include <decaf/io/FilterOutputStream.h>
#include <decaf/io/IOException.h>
#include <decaf/util/zip/Deflater.h>
#include <vector>
```

### Data Structures

- class **decaf::util::zip::DeflaterOutputStream**

*Provides a FilterOutputStream instance that compresses the data before writing it to the wrapped OutputStream.*

### Namespaces

- namespace **decaf**

*Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.*

- namespace **decaf::util**
- namespace **decaf::util::zip**

## 7.882 src/main/decaf/util/zip/Inflater.h File Reference

```
#include <decaf/util/Config.h>
#include <decaf/lang/exceptions/NullPointerException.h>
#include <decaf/lang/exceptions/IllegalArgumentException.h>
#include <decaf/lang/exceptions/IllegalStateException.h>
#include <decaf/lang/exceptions/IndexOutOfBoundsException.h>
#include <decaf/util/zip/DataFormatException.h>
#include <vector>
```

### Data Structures

- class **decaf::util::zip::Inflater**  
*This class uncompresses data that was compressed using the DEFLATE algorithm (see specification).*

### Namespaces

- namespace **decaf**  
*Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.*

- namespace **decaf::util::zip**

## 7.883 src/main/decaf/util/zip/InflaterInputStream.h File Reference

```
#include <decaf/util/Config.h>
#include <decaf/io/FilterInputStream.h>
#include <decaf/io/IOException.h>
#include <decaf/util/zip/Inflater.h>
#include <vector>
```

## Data Structures

- class **decaf::util::zip::InflaterInputStream**  
*A FilterInputStream that decompresses data read from the wrapped InputStream instance.*

## Namespaces

- namespace **decaf**  
*Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.*
- namespace **decaf::util**
- namespace **decaf::util::zip**

## 7.884 src/main/decaf/util/zip/ZipException.h File Reference

```
#include <decaf/io/IOException.h>
```

## Data Structures

- class **decaf::util::zip::ZipException**

## Namespaces

- namespace **decaf**  
*Licensed to the Apache Software Foundation (ASF) under one or more contributor license agreements.*
