# THESIS COMMITTEE

## THESIS SUPERVISORS

**Edward C. Pickering**  
*Professor of Physics*  
*Department of Physics*

**Secunda Castor**  
*Professor of Research*  
*Professor of Knowledge*  
*Professor of Reason*  
*Department of Research*

## THESIS READERS

**Marcus Gavius Apicius**  
*Professor of Cooking Arts*  
*Department of Food Science*

**Marie-Antoine Carême**  
*Professor of Haute Cuisine*  
*Department of Food Science*

**Miles Gloriosus**  
*Professor of Personal Pronouns*  
*Department of Rhetoric*

## ABSTRACT

The developments of the “kinetic theory” of gases made within the last ten years have enabled it to account satisfactorily for many of the laws of gases. The mathematical deductions of Clausius, Maxwell and others, based upon the hypothesis of a gas composed of molecules acting upon each other at impact like perfectly elastic spheres, have furnished expressions for the laws of its elasticity, viscosity, conductivity for heat, diffusive power and other properties. For some of these laws we have experimental data of value in testing the validity of these deductions and assumptions. Next to the elasticity, perhaps the phenomena of the viscosity of gases are best adapted to investigation.<sup>1</sup>
